Changes made to FOG8:
1. Reduce Design Strength of Southern Pine
2. Add 4-4x4 Shore (see Sect 2),
3. Increase Raker Design Strength (see Sect 3)
4. Changed text on pages 5-37 thru 5-50
5. Changed text on pages 5-38 to 5-45 (MSR1 = MSR2)
US&R STRUCTURES SPECIALIST
FIELD OPERATIONS GUIDE (FOG)

FOREWORD
This Field Operations Guide (FOG) was developed by the FEMA US&R Structures Sub-group in cooperation with U.S. Army Corps of Engineers (USACE) as a working reference tool for US&R Structures Specialists and Rescue Team Personnel. It may be printed by them, or their organizations, for their use.

Suggestions should be made to:
Disasterengineer.org
e-mail: admin@disasterengineer.org

In this FOG, Sections 1 through 3 are identical to the same sections of the smaller US&R Shoring Operations Guide (SOG). Section 4 is similar to Sect 4 of the larger US&R Shoring Operations Guide (SOG) and has a new Section R, for Rescue Specialists. Problems, Operational Check Lists, Engineering Data, Tables, and Forms that make it a more useful reference for the SIS. See next page for Table of Contents.

The SOG is intended for use of Rescue Specialists in constructing shoring and other rescue operations, and it has a new Section R, which are identical to the same sections of this FOG. Tables, they are contained along with others in Sect 6.7 of this publication. They are contained along with others in Sect 6.7 of this publication. They are contained along with others in Sect 6.7 of this publication. They are contained along with others in Sect 6.7 of this publication. They are contained along with others in Sect 6.7 of this publication.

In this FOG, Sections 1 through 3 are identical to the same sections of the smaller US&R Shoring Operations Guide (SOG). Section 4 is similar to Sect 4 of the larger US&R Shoring Operations Guide (SOG).

This Publication is intended for the use of US&R Structures Specialists and Rescue Team Personnel. It may be printed by them, or their organizations, for their use.
TABLE OF CONTENTS

The following Sections are contained in this FOG. Each Section has an Outline that gives the order in which subjects are presented

US&R STRUCTURES SPECIALIST
FIELD OPERATIONS GUIDE (FOG)
DEFINITIONS of ENGINEERING TERMS

Kips or K – 1000 pounds
Tons or T – 2000 pounds

Breaking Strength – Force required to cause complete failure of a structure, given in Kips or T – 2000 pounds
Ultimate Strength (also Ultimate Load & Ultimate Capacity) – Force required to cause complete failure of a structure, given in Kips or T – 2000 pounds

For more Definitions, see Sect. 4, Glossary.

Definitions of Engineering Terms

Design Load, Design Strength, & Design Capacity – Some fraction of Ultimate Strength that is used to determine the size or number of Structural Components (posts, etc.) to support a load at Low Risk of Collapse.

Number of Structural Components (posts, etc.) to support a load at the section or Ultimate Strength that is used to determine the size or strength of a Structure (also Ultimate Load & Ultimate Capacity).

Working load, Safe Working Load, & Design Load – same as Design Load

The Shoring Squad should select the posts for straightness and density of grain and minimum number of knots. The Shoring Squad should select the posts for straightness and density of grain and minimum number of knots. See also Sect. 4, Glossary.

Design Load for Wood Structures – due to the variation in the quality of any grade and species of wood it is difficult to predict the breaking strength of a structure, hence it is necessary to select the appropriate design strength and design load for wood structures. For this reason, design strength and design load for wood structures are not specified in this document. Instead, it is recommended that a design factor be used to account for the variability in the quality of wood. The design factor should be selected based on the specific application and the type of wood used. For example, when using Douglas Fir for shoring, a design factor of 2 is recommended. For Southern Yellow Pine, Hem-Fir, & Spruce-Pine-Fir, use 85% of specified design load. For Eastern Softwoods, Western Cedar, & Western Woods use 75% of specified design load.

When nailing 2x lumber with 16d nails one must avoid splitting in order to maintain joint integrity. In cases where 16d are closely spaced, the 16d coated cooler nail (.148" x 3.25") is preferred.

The lumber should be No. 1 Douglas Fir.

For Southern Yellow Pine, Hem-Fir, & Spruce-Pine-Fir, use 85% of specified design load.

For Eastern Softwoods, Western Cedar, & Western Woods use 75% of specified design load.

Design Load for Wood Structures – due to the variation in the quality of any grade and species of wood it is difficult to predict the breaking strength of a structure, hence it is necessary to select the appropriate design strength and design load for wood structures. For this reason, design strength and design load for wood structures are not specified in this document. Instead, it is recommended that a design factor be used to account for the variability in the quality of wood. The design factor should be selected based on the specific application and the type of wood used. For example, when using Douglas Fir for shoring, a design factor of 2 is recommended. For Southern Yellow Pine, Hem-Fir, & Spruce-Pine-Fir, use 85% of specified design load. For Eastern Softwoods, Western Cedar, & Western Woods use 75% of specified design load.

When nailing 2x lumber with 16d nails one must avoid splitting in order to maintain joint integrity. In cases where 16d are closely spaced, the 16d coated cooler nail (.148" x 3.25") is preferred.

For more Definitions, see Sect. 4, Glossary.
INTRODUCTION to SECTION 1
This section contains Documents that are Useful References for the US&R Disaster Site, listed as follows:

- Hazard I.D. & Failure Modes by Bldg Type Page 1-2
- US&R Field Communication Procedures 1-16
- On-Site Emergency Signaling Procedures 1-18
- US&R Building Marking System 1-19
- FEMA US&R Shoring Symbols 1-30
- Design Loads & Weight Estimating 1-31
- Basics of a Monitoring Plan 1-32

HAZARD I.D. and FAILURE MODE SUMMARY
The following pages contain brief descriptions and graphics of the most common building classifications used for US&R Evaluations:

Building Types are:

Wall Systems                      Frame Systems
Light Frame, multi-story          Heavy Floor, C.I.P.
Heavy Wall, URM & Tilt-Up        Heavy Steel Bldgs
Precast Buildings                Light Metal Bldgs

Pages for each bldg type present the characteristics, typical failure modes, hazards, check points, plus hazard reduction and victim access suggestions.

CRITICAL ISSUES:
- Buildings may be varied, of combined types, and complicated.
- Focus on determining the amount of Potential Energy that remains (heavy structure/objects that can collapse or fall.
  - Important to separate Brittle from Ductile Behavior.
  - Judgments may not be able to be precise.
  - Partial collapse is most difficult to assess.
- Make judgments based on what type of forces are expected after initial event (aftershock, high winds, etc).
- Victim Survivability is highly dependent on void formations, void stability, and void accessibility.
- One should always consider Risk/Reward Ratio.
- The viability of the various Mitigation Choices is dependent on the potential for Ductile Behavior of the damaged structure.
1-2

**COMMON COMBINATION**
- Soft-story frames can ruck and collapse.
- Failure should be slow and noisy.

**FAILURE MODES**
- P-delta collapse

**CHARACTERISTICS**
- Many walls cause redundant structures with ductile failure modes, depending on sheathing type.

**KEY PERFORMANCE ASPECTS**
- Residential or Light Commercial
- Mostly wood frame, box type - up to 4 stories.

**TYPICAL FAILURE MODES**
- Failure in Wall Sheathing - Racking of Walls.
- Failure should be slow and noisy.
- Soft/Weak stories can rack and collapse.

**COMMON COMBINATIONS**
- Many are built over RC parking garages.
MULTI-STORY LIGHT FRAME BUILDING (continued)

EXPECTED PERFORMANCE – for the following:

- **Progressive Collapse** – Extensive connection failures. Members & components are likely to remain intact.
- **E. Quake** – Generally good performance - common failure is ductile racking of first story. Racked stories are subject to ratcheting and P-delta collapse in Aftershocks.
- **Explosion** – Walls become disconnected from floors (horizontal diaphragms), leading to part or total collapse.
- **Fire** – Rapid combustion and collapse unless fire resistant.
- **High Energy Impact** – Little resistance to collapse in immediate area. Remainder of structure remains stable.
- **Wind** – Damage is highly dependent on wind speed vs. shape and proper detailing. Tornados can destroy even well constructed wood buildings.
- **Struct Overload/Defect** – Roof failures due to snow, especially on longer span roofs.

CHECK POINTS

- Badly cracked and/or leaning walls.
- Cracked, leaning/loose veneer or chimney.
- Offset of building from foundation.
- Separated porches, split level floors/roof.
- Connection failures - nail pullout/bolt pull-through.

HAZARD REDUCTION

- Shut off gas and reduce other fire hazards.
- Avoid or pull-down damaged veneer and chimneys.
- Place vertical and/or lateral (diagonal) shores.
- Monitor changes in racked/leaning structures.

VICTIM ACCESS

- Vertical access through floor/roof from above collapsed area.
- Horizontal entry through existing cavities, or through walls.
- Remove or shore hazards near victims, if required.
**COMMON COMBINATION**

- Collapsed/Peeled walls create killing hazards.
- Walls spread from roof/floors, leading to swinging walls and roof/floors.
- Specified URM building, wood floors/roofs, leading to swinging walls and roof/floors.

**TYPICAL FAILURE MODES**

- Residential, commercial and industrial occupancies.
- Lack of wall stop anchors - Red brick & CMU houses.
- URM detailing, wood floors/roof - Box pips ≤ 6 stories.

**KEY PERFORMANCE ASPECTS**

- Walls brittle with little resistance to unanticipated loads.
- Redundant interior walls may prevent roof collapse.
- Walls brittle with little resistance to unanticipated loads.

**CHARACTERISTICS**

- Steel joist floors/connections tie in multi-story buildings.
- Heavy timber, light frame walls & floors.

**HEAVY WALL - URM BUILDING - HAZARDS**

- Germansberg building - Box pips ≤ 6 stories.
HEAVY WALL- URM BUILDING (continued)

EXPECTED PERFORMANCE – for the following:

- Progressive Collapse – URM walls likely to disintegrate, and interior structure may stand independently.
- E. Quake – Poor performance - out of plane ext wall failures, loss of connection to floors leading to partial or total collapse. Many lethal Aftershock falling and collapse hazards.
- Explosion – Walls become disconnected from floors (horizontal diaphragms), leading to part or total collapse.
- Fire – Loss of roof/floors will leave walls unbraced. Collapsing roof/floors can thrust walls in or out.
- Wind – Roof vulnerable to uplift, leading to partial or total collapse or roof & walls. Massive masonry is more resistant.
- Struct Overload/Defect – Roof failures due to ponding and snow. Wood decay, brick disintegration or remodeling in older buildings.

CHECK POINTS

- Loose, broken parapets and ornamentation.
- Connections between exterior walls and roof/floors.
- Cracked wall corners and openings, plus peeled walls.
- Unsupported and partly collapsed roof/floors.

HAZARD REDUCTION

- Shut off gas and reduce other fire hazards.
- Diagonally shore, tie-back, avoid, remove hazardous walls.
- Shore hazardous roof/floor beams, etc.
- Monitor changes in racked/leaning structures.

VICTIM ACCESS

- Vertical access through floor/roof from above collapsed area.
- Horizontal entry through existing cavities and openings.
- Remove bricks by hand, excavator, or crane w/clamshell.
- Remove or shore hazards near victims, if required.
COMMON COMBINATION
- Conc. ext walls, wood floors/roof, some steel fl w/concrete fill.
- Long span roof (50ft+) and floors (25ft+).
- Similar performance with CIP conc. or reinforced CMU walls.

KEY PERFORMANCE ASPECTS
- Robust ext walls, but may have weak connection to roof.
- Post 1995 and retrofit building should perform better.

TYPICAL FAILURE MODES
- Walls separate from roof/floors, leading to falling walls and collapsed roof/floors. Long span collapse is probable.
- Office, Commercial & Lt Industrial occupancies – to 4 stories.
- Steel joist, long span floors w/concrete fill.

COMMON COMBINATIONS
- Metal frame walls & floors – 1.5″ concrete fill on floors.
- Conc. ext walls, wood floors/roof, some steel fl w/concrete fill.
- Long span roof (50ft+) and floors (25ft+).
- Conc. ext walls, wood floors/roof, some steel fl w/concrete fill.
HEAVY WALL- TILT UP BUILDING (continued)

EXPECTED PERFORMANCE – for the following:
- **Progressive Collapse** – Out-leaning wall/walls could progress to roof/floor collapse in bay adjacent to exterior. Remainder could stand independently – but poorly braced.
- **E. Quake** – Pre 1995 - poor performance – out of plane ext wall failures, loss of connection to roofs leading to partial or total collapse. Lethal Aftershock falling and collapse hazards.
- **Explosion** – Walls become disconnected from floors (horizontal diaphragms), leading to part or total collapse.
- **Fire** – Loss of roof/floors will leave walls unbraced. Collapsing roof/floors can thrust walls in or out.
- **High Energy Impact** – Impact on exterior walls likely to be localized. Could lead to localized roof/floor collapse.
- **Wind** – Roof vulnerable to uplift, leading to partial or total collapse or roof and walls. Penetration through large doors can lead to critical uplift and blow-out pressures.
- **Struct Overload/Defect** – Roof failures due to ponding and snow. Wood decay in older buildings.

CHECK POINTS
- Connections between exterior walls and roof/floors.
- Beam to beam and other interior roof connections.

HAZARD REDUCTION
- Diagonal or Raker shore concrete walls.
- Shore hazardous roof/floor beams, etc.
- May pull-down leaning walls after dealing w/roof support.
- Monitor changes in racked/leaning structures.

VICTIM ACCESS
- Vertical access through floor/roof from above collapsed area. Horizontal entry through existing cavities and openings.
- Cut holes in wall panels, 2 feet min. from joints.
- Remove large wall panels and roof sections by crane.
US&R STRUCTURES SPECIALIST - FOG

PRECAST BUILDINGS - HAZARDS

CHARACTERISTICS

- PC is used as floor panels in masonry & steel buildings.
- Life of precast masonry shear walls and masonry stud walls.
- May have CIP floor slabs or reinforced concrete topping.

COMMON COMBINATIONS

- Total collapse depending on redundancy.
- Failure of interconnections between parts leading to partial or total collapse.

FAILURE MODES

- Resilience of parts may be highly redundant due to many walls.
- Little capacity for unanticipated loads.
- High energy systems but often brittle connections.

KEY PERFORMANCE ASPECTS

- Typical failure modes are critical to redundancy.
- High energy systems are highly ductile.
- Precast walls may be highly redundant due to many walls.
- Little capacity for unanticipated loads.
- High energy systems but often brittle connections.

COMMON COMBINATIONS

- May have CIP floor slabs or reinforced concrete topping.
- Use of reinforced masonry shear walls and metal stud walls.
- PC is used as floor panels in masonry & steel buildings.

TYPICAL FAILURE MODES

- Resilience of parts may be highly redundant due to many walls.
- Little capacity for unanticipated loads.
- High energy systems but often brittle connections.

CHARACTERISTICS

- PC is used as floor panels in masonry & steel buildings.
- Life of precast masonry shear walls and masonry stud walls.
- May have CIP floor slabs or reinforced concrete topping.

COMMON COMBINATIONS

- Total collapse depending on redundancy.
- Failure of interconnections between parts leading to partial or total collapse.

FAILURE MODES

- Resilience of parts may be highly redundant due to many walls.
- Little capacity for unanticipated loads.
- High energy systems but often brittle connections.

KEY PERFORMANCE ASPECTS

- Typical failure modes are critical to redundancy.
- High energy systems are highly ductile.
- Precast walls may be highly redundant due to many walls.
- Little capacity for unanticipated loads.
- High energy systems but often brittle connections.

COMMON COMBINATIONS

- May have CIP floor slabs or reinforced concrete topping.
- Use of reinforced masonry shear walls and metal stud walls.
- PC is used as floor panels in masonry & steel buildings.
PRECAST BUILDINGS (continued)

EXPECTED PERFORMANCE – for the following:

- **Progressive Collapse** – Failed single story columns have lead to progressive collapse. Heavy elements vs. brittle connections are critical issues. Members retain strength.
- **E. Quake** – Very poor performance – except for multi-wall residence buildings. Failed connections lead to partial or total collapse. Aftershock falling, shifting and collapse hazards.
- **Explosion** – Poor performance due to weak-link connections leading to part or total collapse.
- **Fire** – Could cause annealing of tendons and prestress loss.
- **High Energy Impact** – Impact on ext elements likely to be localized. Brittle connections could be damaged.
- **Wind** – Unlikely to be damaged by wind. Exterior skin and curtain walls could be damaged/destroyed.
- **Struct Overload/Defect** – Failures in connections, leading to cascading structure failure. Members should retain integrity.

CHECK POINTS

- Beam/column connections, broken welds and cracked corbels.
- Column cracking at top, bottom and wall joints.
- Wall connections at floors, columns and foundation.
- Badly cracked walls and columns plus falling hazards.

HAZARD REDUCTION

- Remove/avoid leaning/hanging, concrete elements.
- Shore damaged roof/floor beams, especially next to bad columns.
- Remove/shore unstable wall and floor elements.
- Monitor changes in racked/leaning structures.

VICTIM ACCESS

- Vertical access through thin horizontal sections from above.
- Horizontal entry through existing cavities and openings.
- Cut holes in wall panels, 2 feet min. from joints.
- Carefully remove large wall/floor sections by crane.
HEAVY FLOOR BLDGS (CIP non-DUCTILE) - HAZARDS

COMMON COMBINATION
- Cast in Place (CIP) concrete frames and highway structures, up to 12 stories.
- Few concrete walls, but URM infill in older buildings.

TYPICAL FAILURE MODES
- Brittle failure modes when loaded beyond capacity.
- Post 1975 Ductile Frames in western US have systems that can absorb considerable energy with loss of integrity.
- Partial failure modes when loaded beyond capacity.

KEY PERFORMANCE ASPECTS
- Post 1975 Ductile Frames in western US have systems that can absorb considerable energy with loss of integrity.
- Few concrete walls, but URM infill in older buildings.
- Cast in Place (CIP) concrete frames and highway structures.
- Cast in Place (CIP) concrete frames and highway structures.

COMMON COMBINATION
- May have URM and/or metal stud wall partitions.
- Columns can be partial or complete pancake.
- Beam-column joint failure or column shear leading to partial collapse.
- Several failure modes when loaded beyond capacity.

TYPICAL FAILURE MODES
- Brittle failure modes when loaded beyond capacity.
- Post 1975 Ductile Frames in western US have systems that can absorb considerable energy with loss of integrity.
- Partial failure modes when loaded beyond capacity.

KEY PERFORMANCE ASPECTS
- Few concrete walls, but URM infill in older buildings.
- Cast in Place (CIP) concrete frames and highway structures.

CHARACTERISTICS
- A frame or wall system.
- A series of beam-column joint failures.
- A complete failure of the structure.
- A partial or complete collapse of the structure.
- A loss of integrity of the structure.

HEAVY FLOOR BLDGS (CIP non-DUCTILE) - HAZARDS

DISASTER SITE REFERENCE DATA
USER STRUCTURES SPECIALIST FOG
HEAVY FLOOR BLDGS (CIP non-DUCTILE) (continued)

EXPECTED PERFORMANCE – for the following:
- **Progressive Collapse** – Members likely to break into smaller pieces. Rubble piles may shift.
- **E. Quake** – Very poor performance – Brittle failures of columns and beam/column connections, leading to partial or pancake collapse. Aftershocks cause added collapse, falling hazards and shifting.
- **Explosion** – Poor slab performance due to reverse gravity loading can lead to loss of column stability and collapse.
- **Fire** – May cause spalling of concrete cover on all elements.
- **High Energy Impact** – Damage limited to area of impact. Could leave damaged members of questionable strength.
- **Wind** – Unlikely to be damaged by wind. Exterior skin and curtain walls could be damaged/destroyed.
- **Struct Overload/Defect** – Construction falsework failures most common. Members break into pieces w/poor integrity.

CHECK POINTS
- Beam/column connections above and below floors.
- Badly confined concrete in columns (empty basket).
- Diag. shear cracks in beams and cracking in slabs near cols.
- Attachment of URM walls and other heavy objects.
- Cracks in concrete shear walls and stairs.

HAZARD REDUCTION
- Shore/avoid badly cracked slabs, beams and/or column.
- Shore/avoid overloaded slabs due to punching shear.
- Remove/shore unstable wall and floor elements.
- Monitor changes in racked/leaning structures.

VICTIM ACCESS
- Vertical access through existing access shafts.
- Vertical access by cutting through slabs from above victims.
- Horizontal entry through existing cavities and openings.
- Cut non-bearing/infill walls after careful assessment.
- Remove large pieces by crane, after rebar has been cut.
HEAVY STEEL FRAME BUILDING - HAZARDS

• Heavy "W" steel beam & column framing – 2 to 10 stories.

• Office and Commercial Occupancies, some industrial.

• May have masonry, precast or metal panel exterior walls.

COMMON COMBINATIONS

• May have masonry, precast or metal panel exterior walls.

• Gewelded connections may be subject to brittle failure.

• Normaliy well engineered, but performance is dependent on connection failure leading to partial collapse, total collapse.

TYPICAL FAILURE MODES

• Diagonally braced frames may have buckled cols or braces.

• Welded connections may be subject to brittle failure.

• Normally well engineered, but performance is dependent on connection failure leading to partial collapse, total collapse.

KEY PERFORMANCE ASPECTS

• Gewelded connections may be subject to brittle failure.

• Normaliy well engineered, but performance is dependent on connection failure leading to partial collapse, total collapse.

• Gewelded connections may be subject to brittle failure.

• Normaliy well engineered, but performance is dependent on connection failure leading to partial collapse, total collapse.

COMMON COMBINATIONS

• Gewelded connections may be subject to brittle failure.

• Normaliy well engineered, but performance is dependent on connection failure leading to partial collapse, total collapse.

• Gewelded connections may be subject to brittle failure.

• Normaliy well engineered, but performance is dependent on connection failure leading to partial collapse, total collapse.
HEAVY STEEL FRAME  (continued)

EXPECTED PERFORMANCE – for the following:

- Progressive Collapse – Rare, since members maintain integrity even with damaged/failed joints.
- E. Quake - Good performance of frame - Failure of diagonal bracing and fracture of welded joints have occurred. Facing, especially PC panels could fall and are danger in Aftershocks.
- Explosion – Good performance of frame but wall & floor panels could be dislodged. Frame collapse is unlikely.
- Fire – Plastic deformation of floors and some joint failure. Strength is regained upon cooling. Collapse very rare.
- High Energy Impact – Impacted members are severed/destroyed. Connection failures near impact only.
- Wind – Frame at low risk – Skin, especially glass may be destroyed leading to interior partition failure.
- Struct Overload/Defect – Failures during erection and long-span failures are most common. Members maintain integrity with failures at joints.

CHECK POINTS

- Indications of movement – plumb corners, stair and non-structural damage – as clues to potential structure damage.
- Main beam to column connections – remove finishes as required.
- Broken PC floor and miscellaneous beam bolt connections.

HAZARD REDUCTION

- Shore beams near damaged or broken connections.
- Remove/avoid/tieback damaged exterior facing.
- Monitor changes in racked/leaning structures.

VICTIM ACCESS

- Vertical access by cutting through slabs from above victims.
- Horizontal entry through existing cavities & openings.
- Remove or shore hazards near victims, if required.
Light Metal Building – Hazards

Common Combinations
- Light-gage steel, pre-fab metal buildings – up to 3 stories.
- Masonry, precast or tilt-up exterior walls.

Key Performance Aspects
- Highly engineered with little redundancy or over-engineering.
- Very flexible, especially in lateral directions.

Typical Failure Modes
- Weakest Link Behavior – loss of sheathing allows buckling, leading to collapse of supporting structure.
- Diagonal rod bracing elongation & joint failure.

Characteristics
- Industrial and Commercial Occupancies – mostly 1 story.
- Light-gage steel, pre-fab metal buildings – up to 3 stories.
- Masonry, precast or tilt-up exterior walls.
- Wood or metal interior partitions and mezzanines.

May have masonry, precast or tilt-up exterior walls.
May have wood or metal interior partitions and mezzanines.

Disaster Site Reference Data
User Structures Specialist FOG
LIGHT METAL BLDGS (continued)

EXPECTED PERFORMANCE – for the following:
- **Progressive Collapse** – Joint failure and member buckling could lead to part or complete collapse.
- **E. Quake** – Good performance – Failure of rod bracing is common, but collapse is rare. Minor aftershock response.
- **Explosion** – Skin blown away, possibly leading to frame/roof collapse. Entire building blown away in some cases.
- **Fire** – Rapid loss of strength and collapse due to heating. Long span structure could suddenly collapse.
- **High Energy Impact** – Little resistance to impact. Damage may involve several bays of structure.
- **Wind** – At high risk – as skin is blown away, frames/trusses can buckle and collapse. Frames can rack and collapse.
- **Struct Overload/Defect** – Lateral torsion buckling of built-up members. Joint failure and member buckling, leading to part or complete collapse.

CHECK POINTS
- Broken, elongated and/or buckled rod bracing & connections.
- Buckled purlins, truss members, and steel frames.
- Broken and/or elongated bolt connections + anchor bolts.

HAZARD REDUCTION
- Shore and/or diagonally brace racked building frames.
- Remove loose or lightly connected members and sheathing.
- Monitor changes in racked/leaning structures.

VICTIM ACCESS
- Vertical/Horizontal access by removal or cutting sheathing.
- Horizontal entry through existing cavities and openings.
- Remove or shore hazards near victims, if required.
Effective communication is vital to the safe and successful operations of personnel assigned to a mission in the urban disaster environment. This is extremely important for clear, concise communications between the separate entities, or between personnel within those entities, that will be involved in a major response to an urban disaster. Various US&R task forces deployed to the disaster, and instructions to personnel, state and federal officials and the emergency response and command personnel from the affected and adjacent jurisdictions. This would include emergency personnel within those entities, that will be involved in a major disaster. Effective communication is vital to the safe and successful operations of personnel assigned to a mission in the urban disaster environment.

**COMMUNICATION PROTOCOLS**

- **Phonetic Alphabet**
  - A - alpha (Al fah)
  - B - bravo (BRAH voh)
  - C - charlie (CHAR lee)
  - D - delta (DELL tah)
  - E - echo (ECK oh)
  - F - foxtrot (FOKS trot)
  - G - golf (GOLF)
  - H - hotel (HOH tell)
  - I - india (IN dee ah)
  - J - juliet (JEW lee ett)
  - K - kilo (KEY low)
  - L - lima (LEE mah)
  - M - mike (MIKE)
  - N - november (no VEM ber)
  - O - oscar (OSS car)
  - P - papa (pah PAH)
  - Q - quebec (keh BECK)
  - R - rainbow (RAH nay)
  - S - sierra (SEE air rah)

  - U - uniform (YOU nee form)
  - V - victor (VIK tah)
  - W - whiskey (WISS key)
  - X - x-ray (ECKS ray)
  - Y - yankee (YAHNG key)
  - Z - zulu (ZOO loo)

- **On-Site Emergency Signaling Procedures**
- **Voice Communications Procedures**

The following procedures are identified to promote this standardization for the Structures Specialist:

COMMUNICATION PROCEDURES
### VOICE COMMUNICATIONS PROCEDURES

<table>
<thead>
<tr>
<th>What To Do</th>
<th>Why To Do It</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>1. LISTEN</strong></td>
<td>A. To make sure your transmission won't interfere with another communication.</td>
</tr>
<tr>
<td></td>
<td>B. To be aware of other things going on.</td>
</tr>
<tr>
<td><strong>2. THINK</strong> about what you will say before you transmit.</td>
<td>A. To communicate your idea effectively.</td>
</tr>
<tr>
<td><strong>3. MAKE THE CALL.</strong></td>
<td>A. To be clear.</td>
</tr>
<tr>
<td>Give: a. the call sign or identification of the station called.</td>
<td>A. To be understood.</td>
</tr>
<tr>
<td>b. the words &quot;THIS IS&quot;</td>
<td>A. To be clear.</td>
</tr>
<tr>
<td>c. the call sign or identification of the calling station.</td>
<td>A. To be clear.</td>
</tr>
<tr>
<td><strong>4. COMMUNICATE.</strong></td>
<td>Speak clearly.</td>
</tr>
<tr>
<td><strong>5. USE PHONETICS</strong> for: a. call signs.</td>
<td>A. To be clear.</td>
</tr>
<tr>
<td>b. station identification.</td>
<td></td>
</tr>
<tr>
<td>c. spelling words and names that are not easily understood</td>
<td></td>
</tr>
</tbody>
</table>
Effective emergency signaling procedures are essential for the safe operation of rescue personnel operating at a disaster site. These signals must be clear and universally understood by all personnel involved in the operation. Air horns or other appropriate hailing devices shall be used to sound the appropriate signals as follows:

- **Cease Operation/All Quiet:** 1 long blast (3 seconds)
- **Evacuate the Area:** 3 short blasts (1 second each)
- **Resume Operations:** 1 long and 1 short (O - KAY)

The building marking system was established to ensure:
- Communication of the structural condition and status of US&R operations within a geographically area.
- Differentiation of structures within a geographic area.
- Identification markings on structures may be made with International Orange spray paint (or crayon) placed on the building surface.

**FEMA Building Marking System**

- Structure Identification Marking
- Structure/Hazards Evaluation Marking
- Victim Location Marking
- Search Assessment Marking

There are 4 categories of FEMA US&R Markings:

- Structure Identification Marking
- Structure/Hazards Evaluation Marking
- Victim Location Marking
- Search Assessment Marking

A uniform building marking system has been developed by the FEMA National US&R Response System.

**GENERAL:**

Markers should be placed on normal address side of the structure.

In cases of hurricanes where many structures are involved, a system using a “Stick-on” label should be used. In cases of high winds, where many structures are involved, International Orange spray paint (or crayon) should be placed on the buildingmarkings on structures may be made with International Orange spray paint (or crayon), placed on the building surface.

Effective emergency signaling procedures are essential for the safe operation of rescue personnel operating at a disaster site.
STRUCTURE IDENTIFICATION MARKING

If at all possible, the existing street name and building number will be used. If some numbers have been obliterated, attempt should be made to reestablish the numbering based on nearby structures.

If no numbers are identifiable on a given block, then US&R personnel will assign and identify the street name and numbers based on other structures in the proximity. The structures shall then be numbered to differentiate them (using paint or crayon).

CASE 1 – IF SOME NUMBERS ARE KNOWN, FILL IN BETWEEN

CASE 2 – IF NO NUMBERS ARE KNOWN, FILL IN USE SMALL NUMBERS
It is also important to identify locations within a single structure. The address side of the structure shall be defined as SIDE A. The address side of the structure shall be defined as SIDE A.

The interior of the structure will be divided into QUADRANTS. The quadrants will be identified alphabetically in a clockwise manner starting where the SIDE A and SIDE B perimeter meet. The center core, where all four quadrants meet will be identified as Quadrant E (i.e., central core lobby, etc.).

The address side of Quadrant A shall be defined as SIDE A.
STRUCTURE I.D. MARKING (continued)

Multi-story buildings must have each floor clearly identified. If not clearly discernable, the floors should be numbered as referenced from the exterior. The Grade (or Street) Level Floor would be designated Floor 1 and, moving upward the Second Floor would be Floor 2, etc. Conversely, the First Floor below Grade (or Street) level would be B-1, the Second B-2, etc. For buildings where the street slopes, all at the incident must be informed as to which level will be called the First Floor.

If a structure contains a grid of structural columns, they should be marked with 2’ high, orange letters/numbers to further identify enclosed areas. If plans are available, use the existing numbering system. If plans are not available, **Letter** the columns across the **Long Side** (Side A in this Example) starting from the left, and **Number** the columns along the **Short Side** (Side B in this example) starting from the front, Side A. The story level should be added to each marked Column, and be placed below the Column Locator Mark. Example: "FL-2" = Floor 2.

![Column Grid Layout](image-url)
The Structures Spec (or other appropriate TF member) will outline a 2' X 2' square box at any entrance accessible for entry into any compromised structure. Paint sticks, lumber crayons or aerosol spray-paint cans (International Orange color) will be used for this marking system. Peel & Stick labels or peel & stick paper signs may be used to avoid paint damage. Any identified hazards will be indicated on the right side of the box on the interior of the building. The condition of the structure at the time of the assessment can be evaluated. It is important that an effort is made to mark all normal entry points and identify the lowest risk entrance. An arrow will be placed next to the box indicating the direction immediately adjacent to the entry point identified as lowest risk. Normally the marking (or placards) would also be made at normal entry points. The specific markings will be made inside the box to indicate the condition of the structure at the time of the assessment. Any identified hazards will be indicated, outside of the box, on the right side of the box (placards have space below the box for comments on hazards). Each subsequent assessment is performed throughout the course of the mission, new TIME, DATE, and TASK FORCE ID will be placed next to the box indicating the direction immediately adjacent to the entry point identified as lowest risk. All Task Force personnel must be aware of the possibility of new markings made if the original information is now incorrect. (See example on Page 1-25)
US&R STRUCTURES SPECIALIST FOG
DISASTER SITE REFERENCE DATA

STRUCTURE/HAZARDS EVALUATION MARKING

The depiction of the various markings is as follows:

- **Low Risk** for US&R Operations, with low probability of further collapse. Victims could be trapped by contents, or building could be completely pancaked or soft 1st story.

- **Medium Risk** for US&R Ops, and structure is significantly damaged. May need shoring, bracing, removal, and/or monitoring of hazards. The structure may be partly collapsed.

- **High Risk** for US&R Ops, and may be subject to sudden collapse. Remote search operations may proceed at significant risk. If rescue operations are undertaken, significant and time-consuming mitigation should be done.

Arrow located next to a marking box indicates the direction to the lowest risk entrance to the structure, should the marking box need to be made remote from the indicated entrance.

Indicates that a Hazardous Material condition exists in or adjacent to the structure. Personnel may be in jeopardy. Consideration for operations should be made in conjunction with the Hazardous Materials Specialist. Type of hazard may also be noted.
The TIME, DATE, and TF ID, are noted outside the box at the right-hand side. This info is made with paint stick or lumber crayon. The paper (or cardboard), stick-on placards may need to be attached using duct tape to assure their positioning.

This example is for a Medium Risk building, and the arrow indicates the direction to the lowest risk entry (possibly a window, upper floor, etc.). Assessment was made on July 15, 1991, at 1:10 PM. There is an indication of carbon dioxide in the structure. The evaluation was made by the #1 TF from the State of Oregon. It should be understood that this building would not be entered until the Hazmat (carbon dioxide) had been mitigated. When that mitigation is performed, the mark should be altered by a placing a line thru the HM and adding the time and TF who performed the mitigation. An entirely new mark could also be added when the mitigation is done, or after any change in conditions such as an aftershock. To indicate changed conditions in conditions such as an aftershock. To indicate changed conditions when using labels or placards, one may cross-out the hazard if mitigated or just replace the label/placard if appropriate.

Marking boxes may also be placed in each of the specific areas hazardous conditions are present at the building. These may be placed in separate parts of the building. Hazardous conditions in separate parts of the building may also replace the label/placard if appropriate.

It should also be noted that this building might not be entered in many situations, such as:

- Structures when StS are present at all times during the incident.
- Structures when StS are present at all times during the incident.
- Structures when StS are present at all times during the incident.
- Structures when StS are present at all times during the incident.
- Structures when StS are present at all times during the incident.
- Structures when StS are present at all times during the incident.
- Structures when StS are present at all times during the incident.
- Structures when StS are present at all times during the incident.

HM - natural gas
7/15/91 1310 hrs.
OR-TF1
STRUCTURE/HAZARDS PLACARD
Should be printed on adhesive backed, 8.5" x 11" heavy white paper, Rite-on Rain paper, or light cardboard. Cut in half to obtain two placards.

White color was selected to avoid being confused with the Green – Yellow – Red Placards that are placed during Safety Evaluation of Structures by non-US&R Engineers.
A separate and distinct marking system is necessary to denote information relating to the victim location determinations in the areas searched. This separate Search Assessment marking system is designed to be used in conjunction with the Structure and Hazards Evaluation marking system. The Canine Search Specialists, Technical Search Specialists, and/or Search Team Manager (or any other Task Force member performing the search function) will draw an "X" that is 2' X 2' in size with International Orange paint stick, lumber crayon or color spray paint (note that K9 may be adversely affected by the fumes from spray paint). This X will be constructed in two operations - one slash drawn upon entry into the structure (or room, hallway, etc.) and a second crossing slash drawn upon exit. The X will be used to indicate the beginning of search operations are currently in progress. Single slash drawn upon entry to a structure or area indicates search operations are currently in progress.

Distinct markings will be made inside the remaining quadrants of the X to clearly denote the search status and findings at the time of this assessment. The marks will be made with carpenter chalk or lumber crayon. The following illustrations define the Search Assessment marks:

Assessment Marks:

OR-1
2-10-02
1100
2-10-02
1100
AFTER EXITING & DRAWING the 2nd SLASH, add the following INFO:

TOP QUADRANT - Time and date that the Search Team personnel left the structure.

RIGHT QUADRANT - Personal hazards.

BOTTOM QUADRANT - Number of live and dead victims still inside the structure. ["0" = no victims]

When the Recon Team leaves a structure WITHOUT completing the Search (aftershock, end of shift, etc), then the second slash WILL NOT be made. A Solid Circle is drawn at the mid-length of the First Slash, and Date/Time of Exit, Personal Hazards, & Victim Info will be filled in. Also indication of Quadrants or Floors completed should be added in a BOX below the X, or if the Bldg HAS NOT been entered (as in Hurricanes) mark No Entry in the BOX.
In most cases, extemporaneous information will not be conveyed using the marking system. This type of communication will usually take place as a result of face-to-face meetings between Search, Rescue, and other components of the Task Force.

Search Markings should be made at each area within a structure, such as rooms, voids, etc. The marking system can be used to convey information related to the results of the search and rescue operations. The marking system should be used to identify potential and known victims.

Victim Location Marking System

- The amount and type of debris in the area may completely cover or obstruct the location of any victim.
- The location of potential and known victims is necessary to identify the victim during the search function.

The following illustrates the marking system:

- An adhesive-backed search mark placard has been approved for use in incidents like Hurricanes and large earthquakes where many structures are involved. All FEMA Task Forces have been supplied with the graphic to be used in creating the stick-on search marks, which should be printed on orange paper. See Library, Disasterengine.org for more information.

The victim location marks are made by the search team or others aiding the search and rescue operations whenever a known or potential victim is located and not immediately removed.

The victim location marks should be made on orange spray paint (using the marking or downward spray paint). The victim location markings should be made with orange spray paint (using the marking or downward spray paint).
VICTIM LOCATION MARKING SYSTEM (cont.)

Make a large (2’ x 2’) “V” w/orange paint near the location of the known or potential victim. Mark the name of the search team as shown.

An arrow may need to be painted next to “V” pointing towards the victims location is not immediately near where the “V” is painted. Show distance on arrow.

Paint a circle around the “V” when a potential victim has been Confirmed to be alive either visually, vocally, or by hearing sounds that would indicate a high probability of a victim. If more than one confirmed live victim, mark total number under the “V”.

Paint a horizontal line through the middle of the “V” when a Confirmed victim is determined to be deceased. If more than one confirmed deceased victim, mark the total number under the “V”. Use both live and deceased victim marking symbols when a combination of live and deceased victims are determined to be in the same location.

Paint an “X” through the Confirmed victim symbol after all victims have been removed from the specific location identified by the marking.

- Paint new victim symbols next to additional victims that are later located near where the original victim(s) were removed. (assuming original symbol has been “X”-ed out).
These symbols were developed by the FEMA US&R Structures Sub-group, and should be used to map locations of US&R Shoring.

</tbody>
</table>

### Wood Floors
- Weigh 10 psf to 25 psf (25 with 1.5" conc fill)

### Steel Floors
- With metal deck & conc fill weigh 50 to 70 psf

### Concrete Floors
- Weigh from 80 to 150 psf

### RESCUE LIVE LOADS
- Add 10 to 15 psf for Rescuers (4-250lb in 100 sq ft = 10 psf)
- Also need to account for heavy tools

### QUICK WEIGHT ESTIMATING (per square foot)

**BASICS OF MONITORING PLAN**

- **Determine where, how, & direction of expected movement.** What should be monitored, what tools should be used, and the expected direction of the movement.

- **Establish Control and Reference Points.** With Total Station, setup the X, Y, and Z directions.

- **Control Points should not be susceptible to movement caused by wind, temperature change, and/or light wind, etc.**

- **Careful vs. Alarm:** what are normal and what are extreme movements of this type of structure.

- **Communication Protocols:**
  - What is the communication chain?
  - Who has authority to sound alarm?
  - What is the plan for responding to the alarm?

- **How often to Record Data:**
  - Initially every few minutes.
  - After performance is established, at least hourly.
  - Make extra readings following aftershocks and extreme winds, or other significant changes in loading.

- **Record Keeping:**
  - StS should keep a Field Log, as well as using the StS Monitoring Forms. See Sect 9 & disasterengineer.org

- **Story Drift:**
  - Angle in degrees vs. Displacement of 12 ft story.

<table>
<thead>
<tr>
<th>Angle</th>
<th>0.01° 0.05° 0.10° 0.15° 0.20° 0.40° 0.60° 0.80°</th>
</tr>
</thead>
<tbody>
<tr>
<td>0°</td>
<td>0.025” 0.126” 0.251” 0.337” 0.502” 1.0” 1.51” 2.01”</td>
</tr>
</tbody>
</table>

- **Reference Movements:** Here is the “normal” structure movement per story. They are rough estimates—caused by sun angle and temperature change, and/or light wind, etc.

  - Concrete = 0.025° (0.0025 deg)
  - Steel = 0.050° (0.005 deg)
  - Wood = 0.10° (0.010 deg)

- **Expected Direction of the Movement:**
  - Establish Control and Reference Points. With Total Station.

- **Expected Direction of the Movement:**
  - Establish Control and Reference Points. With Total Station.

- **Expected Direction of the Movement:**
  - Establish Control and Reference Points. With Total Station.

- **Expected Direction of the Movement:**
  - Establish Control and Reference Points. With Total Station.
INTRODUCTION to SECTION 2

This section contains General Information, Graphics and Detailed Explanations of how to construct FEMA Vertical Shoring – arranged as follows:

Key Design Parameters. Page 2-1
Estimated time to build Shores & Multi-Story Conditions. 2-2
Shoring Size-up, Inspection, and the Shoring Team. 2-4
Notes and Nailed Connections for Vertical Shores. 2-8
How to construct simple Vertical Shores 2-15
How to construct Laced Post & Ply’d Laced Post Shores 2-30
How to construct Sloped Floor Shores 2-40
Alternate Methods for building Vertical Shores 2-43
How to construct Cribbing +Window and Door Shores. 2-44
Vertical Shoring Systems using Pneumatic Struts. 2-55

KEY DESIGN PARAMETERS

- How to configure US&R Shoring to ensure a Predictable and Slow initial Failure Mode.
- How to sequence the construction of US&R shoring in order to Minimize Risk.
- Use of the Class 1, 2, and 3 System Approach:
  - Class 1 = 1 Dimensional
  - Class 2 = 2 Dimensional
  - Class 3 = 3 Dimensional
- All posts should be proportioned and braced so that cupping of the wedges and crushing of header will occur before post buckling. This is assured if post L/D (Ht/Width) is 25 or less.
- Basic construction sequence should proceed as follows:
  - In very dangerous areas, it would be prudent to reduce risk by quickly installing Class 1 Spot Shores.
  - Follow w/ Class 2 (two or more post) Vertical Shores. (In some cases Class 2 shores may be built as initial shoring).
  - Finally, assure that all Shoring has all Posts braced in two directions as Class 3 Shores. An efficient way that this can be achieved is as follows:
    1. Place T or Double T shores initially if very dangerous.
    2. Then place pairs of 2-post Vertical Shores, 4 ft apart.
    3. Lastly tie 2-post vert. shores together as Laced Posts.
The following table assumes that one, 6-person Rescue Squad is used, who have worked together before and have had proper training in building shoring. Also, it is assumed that the tools, lumber and equipment are all laid out and ready to go.

### Pre-Fabricated Shoring Systems

</tr>
</tbody>
</table>

### NOTE for Carry Conditions

These times do not account for moving the pre-assembled shore. That would have to be determined on-scene at each event. The times listed above are for use in building shoring. As such, we do not assume that tools, lumber and equipment are all laid out and ready to go. Among other things, no pre-assembled shores are assumed.
US&R STRUCTURES SPECIALIST FOG
CONSTRUCTING VERTICAL SHORING SYSTEMS

TIME TO BUILD SHORES - SPECIFIC CONDITIONS

**Example 1 (Vert, Crib, Laced Post & Sloped floor)**
Like Pentagon, Puerto Rico, (similar to OKC)
1st & 2nd story, Shore your way in, remove debris as you go.
Material & cutting area within 200ft outside.
**ADD 10 min for 1st floor and 15 min for 2nd floor.**
Traveling thru heavy debris add 10minutes more.

**Example 2 (Vert, Crib & Sloped floor)**
10 story concrete bldg - Need to carry material upstairs into bldg.
Partly prefab in safe area on same floor. Need to move furniture,
desks, etc to go 60 to 100 ft across floor to collapsed area.
**ADD 5 min for each additional floor ascended.**

**Example 3 Each Pair of Raker Shores**
12 ft insertion point up Tilt-up wall - AC paving, parking lot next to building not much debris.
**Each Pair to be Assembled, Installed & Braced in 30 min.**

**Example 4 Each Pair of Raker Shores**
9 ft insertion point up URM wall w/ some debris.
AC paving or Dirt next to wall.
Use Split sole Rakers w/ sloping sole.
**Each Pair to be Assembled, Installed & Braced in 40 min.**

MULTI-STORY CONDITIONS & SEQUENCING
When shoring a single damaged floor in multi-story building the following approach may be used:
- For Wood-frame, 1-undamaged fl can support 1-damaged fl.
- For Steel-frame, 2- undamaged floors to support 1- damaged fl
- For Reinf. Conc, 3-undamaged floors to support 1- damaged fl.
- For Precast Conc, the shoring should extend to the ground.
- This does not apply to structures that are under construction, subject to cascading/progressive collapse, or to structures that have collapsed suddenly, without any apparent cause.
- Usually the best strategy for multi-story shoring is to start directly under the damaged floor, and work down.
1. Use Sloped Floor Shores 8 Cribbing for limited height conditions.
2. When possible, jacks. Support beams under joists or plenum, if possible.
3. For wood structures, place shores perpendicular to joist and check for sagging beams/brackets, 
4. Make sure beams are supported, as well as damaged connections.
5. Shoring beams that support. Sheds or roofs is most desirable.
6. Sagging or sloped floors: Bunging of creaked floors.
7. Look for broken connections. Cut out plumb; Rackled openings:
   - Shore under debris pile.
   - Truss: or bayed creaked concrete.
   - Beams sagging beams/brackets: Wood or steel.
8. What will support the shoring? Shed on ground; Soil; Basement.
9. Where is the condition of structure? Solid but cracked slab?
10. Where is the condition of structure? Solid but cracked slab?
11. Rackled or buckled?
12. For wood structures, place shores perpendicular to joist and align posts under joist.
13. Use Sloped Floor Shores 8 Cribbing for limited height conditions.
SHORING SIZEUP (continued)

Prepare the area to be shored:
1. May need to remove debris and floor coverings.
   - Install temporary, spot shores if needed – reduce risk.
2. If soil supported, use an 18”x18” foot under post locations.
3. Consider temporary shores to reduce risk (T or Dbl-T).
4. Prefabricate shoring as much as possible to reduce risk.
5. Add bracing after wedges are tightened.

SHORING INSPECTION

Inspect shores every 12 hours (Shift Change), and/or following any known loading change such as:
1. Aftershocks
2. High Winds,
3. Secondary Explosion,
4. Load Shift and/or Change.

Check for proper construction of shore
1. Check to see if posts are straight, plumb, and have full bearing on header and wedges.
2. Are connections tight and wedges snug?
3. Is header in full contact with supported structure?
4. Has sole deflected due to soft soil or support?
5. Are all components of shoring system in place?

Check for signs of overload.
7. Crushing of header at post.
8. Splitting of header at end of overhang.

Actions to be taken if signs of overload are observed.
9. Add additional shoring.
10. Have structure re-evaluated by a StS to see if it is responding differently than expected.
11. Check assumptions of original shoring design.
To conduct Shoring Operations safely and efficiently, two separate Shoring Teams are formed.

1. The Shore Assembly Team
   - Performs the actual shoring size-up and construction of the shores.

2. The Cutting Team
   - Establishes the equipment area and cuts the shoring lumber.

3. The Shore Assembly Team consists of the following:
   - The Shoring Officer (Rescue Squad Officer) – is in charge of setting up the cutting station and preparing the materials to be cut. He is in direct contact with the shore assembly team.
   - The Measure – performs all measuring required in the erection of the shoring and relays all measurements and lumber size to the Layout of the Cutting Team.
   - Shores – clears away debris and obstructions that could interfere with shore construction. He also assists the Shoring Officer in determining where to place the shores.

4. The Cutting Team
   - The layout – is in charge of setting up the cutting station.
   - The Measure – performs all measuring required in the erection of the shoring and relays all measurements and lumber size to the Shore Assembly Team.
   - The layout – is in charge of setting up the cutting station.
   - The Measure – performs all measuring required in the erection of the shoring and relays all measurements and lumber size to the Shore Assembly Team.

The initial responsibility of the cutting team is to secure an area as close as possible to the collapse area to expedite the movement of equipment to the collapse area.
THE SHORING TEAMS (continued)

c. **Tools and Equipment** – directs the movement of tools and equipment to be placed where they are requested, anticipates logistical needs of the shoring team and keeps an inventory checklist/log sheet for easier retrieval of tools and equipment at the conclusion of rescue operations.

5. A single Rescue Squad can normally fill the six individual shoring team positions during most shoring operations.

6. Larger or more complex shoring operations may require Two Rescue Squads, with One squad assigned to the Shore Assembly Team and the Other assigned to the Cutting Team.

7. **Shore Assembly Team** with a Six person Rescue Squad:

   a. The **Shoring Officer** (Rescue Squad Officer)
   b. The **Measure**
   c. **Shores**
   d. **Shores**
   e. **Safety**
   f. **Runner** – ensures tools, equipment, and shoring materials are moved from the shoring operation primary access point to the shoring site and assists in the erection of shores as needed.

8. Cutting Team with a complete Six person Rescue Squad:

   a. The **Cutting Team Officer** (Rescue Squad Officer)
   b. The **Layout**
   c. The **Feeder** – moves and feeds measured and marked shoring material from the **Layout** to the **Cutter** and helps secure it when being cut.
   d. The **Cutter**
   e. **Tools and Equipment**
   f. **Runner** – ensures tools, equipment, and shoring materials are moved from the cutting area to the shoring operation primary access point.
2-8

NOTES REGARDING SHORE STRENGTH

1. The strength of Wood Systems depend on the following:
   • Perpendicular to grain bearing of Post on Header.
   • Vertical capacity of Posts (based on Height (Length).
   • Strength of Header and Sole.
   • Strength of ground or floor slab below Sole.

2. The size of a Header depends on the stiffness of the header compared to the structure being supported:
   • When supporting intact concrete slabs, the concrete structure is usually much stiffer than the header. In this case, the header is usually much stiffer than the structure. This is why the header is usually much stiffer than the structure.
   • When supporting concrete structures, the header is usually much stiffer than the structure.

3. The Total Length of 2x4 & 2x6 Lacing (diagonal bracing members that are capable of resisting both tension and compression) should be limited to 7'-6".
4. If the length of 2x4 & 2x6 diagonal bracing members is greater than 7'-6", then they must be configured as X-bracing, since each member is only capable of resisting Tension.
5. Pickets are 1" dia. x 36" min. Grade A-36 plain steel rods or Grade 60 rebar, driven a minimum of 24" into soil or paving.

6. Shoring Numbers to Remember (for No.1 Douglas Fir)
   • 8, 20, 24, 32, 48
   • 8K is Design Load of 4x4 Post, 8 ft long
   • 20K is Design Load of 6x6 Post, 12 ft long
   • 24K is Design Load of 2x2 lay-up of 4x4 Crib
   • 32K is Design Load of 4x4 Laced Post
   • 4K is Design Load of Single 4x Full Ht. Raker

US&R STRUCTURES SPECIALIST FOG
CONSTRUCTING VERTICAL SHORING SYSTEMS

NOTES for VERTICAL SHORING DIAGRAMS

1. Maximum Post Heights have been specified as 10'-3", 12'-3", etc., and Shore is then limited to next Full Foot in Height.

2. Design Load (Safe Working Load) for Class 1 & 2 Shores is based on Shore Height. (Not post length).

3. The use of 4x4 & 6x6 Headers is desirable, since this maintains a relatively stable 1 to 1 height to width ratio. This allows the use of one sided connections to headers.

4. It is desirable to use 2-sided connections at Posts to Sole Plates at Wedges. The connectors should be 6"x12", Half Gussets each side, or a 2x Diagonal Brace one side and Gusset to opposite side. Gussets may be cut from 5/8" or 3/4" plywood or Oriented Strand Board (OSB).

5. For wood or light metal floor/roof systems, 1-sided connections, at wedges, may be used in situations where lateral displacement of the shore is unlikely. Displacement may be caused by lateral loads, vibrations, and/or structural shifting.

6. Use of 4x4 Headers for 4ft o.c. Posts and 6x6 for 5ft o.c. Posts is based on supporting Normal Wood Floors and Intact Concrete Floors. For supporting badly cracked Concrete Floors, and for shores with larger post spacing, obtain special design by US&R Structures Specialist.

7. Backing above Headers may be required if one is supporting a badly cracked concrete or masonry structure.
   • May use 2x10 or 2x12, full length centered on top of header, or 8ft long strips of 12" to 16" wide, 3/4" plywood.

8. Backing should be used under the Sole at each post when bearing on soil. Use 3-2x6x18" or 2-layers of 18"x18"x 3/4" plywood centered under posts. See below:

2-9
CONSTRUCTING VERTICAL SHORING SYSTEMS

Nailed Connections for Vertical Shores

US&R STRUCTURES SPECIALIST FOG

2-10

6. Duplex nails are used in some cases at wedges. In order to allow for pulling the nails when adjusting the wedges.

5. SD nails should be 0.137" x 2.5" with a plastic coating.

4. The preferred Tdg nail is a 0.148" x 3.25" straightedger nail.

3. Clip head nails may be used, but care must be taken to not over-drive the nails. No V head nails. Full head nails and duplex nails are preferred. The head is set off-center for most gun nailers. Gun nailers normally produce less impact vibration. Palm nailers produce the least amount of vibration.

2. Hand or gun driven nails may be used. However, gun driven nails are not to transfer direct loads.

1. Nails are used to connect members together in Vertical Shores, but are not to transfer direct loads.

Nail Standards

<table>

</tr>
</tbody>
</table>
PLYWOOD GUSSETS and BRACES
Plywood may be 5/8" or 3/4" thick, (or may use OSB where wet conditions will not occur) Use 8d nails.

**FULL GUSSET – 12" X 12"

**HALF GUSSET at Vertical Shore

**Dbl Gusset to Header - Dbl T & 2'x 4' PLP

**Half Gusset at 2-Post & Laced Post

**Dbl Gusset for Dbl T Mid-braces

HALF AND DOUBLE GUSSETS
2-12

PLYWOOD BRACES (continued)

8" x 48" Plywood, Top & Bottom Brace for 2'x 4' & 4'x 4' Plywood Laced Posts
5-8d each end

Plywood Laced Post (PLP) - Middle Braces
24" x 24" for 2 ft. side of 2'x 4' PLP
24" x 48" for 4 ft. sides of 2'x 4', 4'x 4' PLP
11-8d each end (2-5 patterns + 1 middle)

NAILLED CONNECTIONS (2x6 and 2x4 Braces)

Use 16d coated nails (0.148" x 3.25")
Also note placement of nails away from the ends of the 2x.
NAILED CONNECTIONS of 2x6 and 2x4 to HEADER

2x4 & 2x6 diagonal braces are used here to provide bracing, as well as connect the post to the header. Carefully place diagonal so that required nails can be driven without splitting the post. (For conditions where 5-16d will split the post, 3-16d may be used)
2x4 wedges are 17" long. 4x4 or 4x6 wedges are 18" long.
May use 16d duplex keeper nails.
Sloped surfaces must be in full contact.

DETAILS: 2x4 or 4x4, 6 WEDGES

- 2-Post Vertical Shore 2-26
- Laced Post Shore 2-30
- 2’ x 4’ Plywood Laced Post Shore 2-34
- 4’ x 4’ Plywood Laced Post Shore 2-37
- Type 2 Sloped Floor Shore 2-40
- Alternate Methods for Vertical Shores 2-43
- Type 3 Sloped Post Shore 2-44
- Cribbing 2-46

Design Loads that are listed herein are for Shores built using No. 1 Douglas Fir. For Design Loads when using other lumber species, see page 2-43
Design Load is 4,000lb - ONLY IF LOAD IS CENTERED

Maximum Height = 11 ft

Rapidly installed temporary shore, intended to be used only until a complete shoring system can be installed. It can become unstable if it is not centered under the load.

Material List:
- One Header and Sole
- One Wedge Set
- Two Full Gussets
- One Half Gusset
- One Full Gusset

T SPOT SHORE (Vertical/Class 1)
HOW TO CONSTRUCT THE T SPOT SHORE

1. Determine where T Spot Shores should be built in order to quickly reduce risk. (Prior to building more stable shores).
2. Determine height of area to be shored and remove least amount of debris required to place the shore.
3. The 4x4 post should be 10’-3” max long, so that the total height of the shore is not more than 11 feet.
4. Cut header and sole to 3 feet long.
5. Cut post to proper height (remember to deduct header, sole and wedge height when cutting post).
6. Prefabricate header to post.
   - Toe-nail post to header and make square.
   - Place and nail Full Gusset plate on one side.
   - Flip shore over and place/nail another Full Gusset on other side.
7. Place T Shore in position, centered under the load.
8. Position header across (perpendicular to) the roof/floor joists and position the post directly under a joist.
9. Slide sole plate under T and tap wedges into position.
10. Check for straightness & position directly under the load, and then tighten the wedges.
11. Install bottom Half Gusset; nail 4-8d to post and to sole.
12. Note that a 2 x 4 x 18” cleat may be used, but the 3-16d nails to post and sole may tend to split the cleat. Also the nailing of 16d causes more impact within the danger zone than for 8d nails.
13. Anchor the shore to floor above and sole to floor below, if practical.
Design Load is 32,000lb - No. 1 Doug Fir

Material List:
- 2-4x4x3ft Header & Sole
- 2-4x4x3ft Wedge Sets
- 4 - 6x5/8x 96” ply ties
- 4 - 6x5/8x 3’ ply ties
- 4 - Full Gussets
- 4 - 4x4 Posts x 12ft max.

High capacity point shore, intended to be used directly under beams, where laced posts do not provide for good transfer of the load. Assumes that structure has adequate lateral bracing.
US&R STRUCTURES SPECIALIST FOG
CONSTRUCTING VERTICAL SHORING SYSTEMS

HOW TO CONSTRUCT THE 4-4x4 T SHORE

1. Determine height of area to be shored and remove least amount of debris required to place the shore.

2. The 4x4 posts should be 12' ft max long, so that the total height of the shore is not more than 12'-8"
   - Note: For point shore longer than 12'-8" use single 6x6.
   - Design Load for these heights: 14ft Long = 15k ; 16ft = 12k ; 18ft= 9k; 20ft = 7.5k.

3. Cut Headers and Soles to 3 feet long, and toenail them together in pairs.

4. Cut post to proper height (remember to deduct header, sole and wedge height when cutting post).

5. Prefabricate posts and header to post.
   - Toe-nail all 4 posts together - all 4 sides.
   - Nail 96" long ply tie to posts, all 4 sides. Center on posts.
     - Nail 8d@5"o.c. staggered to each 4x4.
   - Nail 8" ply ties to posts, 2 sides top & bottom1/2" from ends.
     - Nail 5-8d to each post.
   - Toe-nail posts to headers and make square.
   - Place and nail Full Gusset plate on one side (header to posts).
     - Nail 5-8d to each post and 8-8d to header
   - Flip shore over and place/nail another Full Gusset on other side.

7. Place T Shore in position under the beam or girder
   - Position header directly under beam. Orient header perpendicular to beam, and exactly centered on beam

8. Slide double sole plate under T and tap wedges into position.

9. Check for straightness & re-check position directly under the load (centered on beam), and then tighten the wedges.

10. Install bottom Gussets each side
    - Nail 5-8d to each post , and 8-8d to sole, each side.

11. Anchor the shore to floor above and sole to floor below, if practical.
Design Load – based on shore height

16,000 lb – 8 ft, 10,000 lb – 10 ft, 7,000 lb – 12 ft

This is the most stable spot shore, and much preferred to the marginally stable T-Shore.

Double T Shore (Vertical Class 2)
HOW TO CONSTRUCT THE DOUBLE T SHORE

1. Determine overall height of area to be shored and remove least amount of debris required to place the shore.
   - The 4x4 post should be 11'-3" maximum long, so the total height of the shore is not more than 12 feet.

2. Measure and cut 4x4 header, sole and post (remember to deduct header, sole and wedge height when cutting post).
   - Header and sole are 3 feet long.

3. Prefabricate header to posts.
   - Toe-nail posts to header and make square.
   - Place and nail Double Gusset plate on one side of both posts.
   - Nail 5-8d to each post and 14-8d to header.
   - Flip shore over and place another Double Gusset on other side.

4. Nail mid-height plywood, Double Gusset to one side of posts (8-8d to each post).

5. Place Double T in position, centered under the load.

6. Slide sole plate under Double T and tap 2x4 wedges into position.

7. Check for straightness plus stability, and then tighten wedges.

8. Install bottom Half Gussets and nail 4-8d to each post and sole.

9. Anchor the shore to floor above and sole to floor below, if practical.
US&R STRUCTURES SPECIALIST FOG
CONSTRUCTING VERTICAL SHORING SYSTEMS

VERTICAL SHORE (Vertical Class 2)
This shore normally is built in-place in the danger zone.
Spot shores should precede the erection of this shore.
Material List:
1 Header & 1 Sole
1 -Wedge Set each post
2 or more Posts
2 - 2x6 Diagonals ("X")
Half Gussets – 5 for 3-post, 8 for 4-post, & 11 for 5-post
Mid-brace (1 x 6 or 6" ply) see Additional Information

4 – Post Vertical Shore (may have 3 or 5 posts)
Design Load 4 x 4 posts:
Height = 8 feet
Height = 10 feet
Height = 12 feet
Design Load 6 x 6 posts:
Height = 12 feet
Height = 16 feet
Height = 20 feet

8,000 lb each post
5,000 lb each post
3,500 lb each post
20,000 lb each post
12,000 lb each post
7,500 lb each post
2-22


HOW TO CONSTRUCT THE VERTICAL SHORE

1. Survey, install spot shores (if needed), and remove least amount of debris required to place the shore.

2. Lay the sole plate on the floor or ground directly under and in line where header will be installed. Sole plate should be level. Add 3-2x6x18” (foot) under sole at posts for soft soil conditions.

3. Measure and cut the posts to the proper height:
   - Place the header on top of the sole plate.
   - Place the end of the tape measure on top of the header at both ends and at its middle, to find the distances to the bottom of the structure to be shored. After deducting for wedges, use smallest dimension for all posts. (assumes near-level conditions)

4. If possible, anchor the header to the area that is to be shored, square and in line with the sole plate. Secure it at the lowest point and shim the structural elements down to the header trying to keep it as level as possible.

5. Install the posts between the header and sole plate under each structural element to be supported. 4x4 Posts should be spaced 4 feet on center, maximum.
   - Install first two posts 12” from ends of header.
   - Toe-nail each post to header and sole, and keep the posts in line & plumb with header and sole plate.

6. Install a set of 2x4 wedges under each post, on top of Sole, and tap them together simultaneously until the posts are tight. Toe nail behind the wedges to secure them.

7. Attach the diagonal braces to each side of the vertical shore.
   - Mid-point brace, when needed, should be installed prior to the diagonal braces.
   - The diag. braces should be long enough to span its entire length and be attached to the sole plate and header and each post.
   - If possible, diagonal braces should be installed in a "X" pattern on opposite sides of the system.
   - Vertical shoring systems which are very long may require several sets of diagonal braces.

8. Attach half-gussets to one side of header to post, except where diagonal braces attach. Add Half Gussets to each side of each post to sole plate, except where diagonal braces attach (then only one side). Nail with 8-8d. (Also see note 5. On page 2-9)
ADDITIONAL INFORMATION

1. Maximum shore height for 4 x 4 posts: 12 feet.
2. Maximum shore height for 6 x 6 posts: 20 feet.
3. Posts:
   - 4 x 4 minimum.
   - Spacing for 4 x 4 posts: Maximum 4 feet on center.
   - Spacing for 4 x 4 posts: Maximum 4 feet on center.
   - Spacing for 4 x 4 posts: Maximum 4 feet on center.

4. Header and Sole:
   - Same size as posts in most cases.
   - Same size as posts in most cases.
   - Same size as posts in most cases.
   - Same size as posts in most cases.

5. Backing under Sole on Soil:
   - Use 3-2x6x18” under sole centered on each post.
   - Use 2x6x18” under sole centered on each post.
   - Use 2x6x18” under sole centered on each post.
   - Use 2x6x18” under sole centered on each post.

6. Wedges: 2x4 for 4x4 posts & 2x6 or 4x6 for 6x6 posts.
   - 5-16d to each post.
   - 5-16d to each post.
   - 5-16d to each post.
   - 5-16d to each post.

7. Half Gussets at Bottom:
   - Each side to confine wedge, except when diagonal connects.
   - Each side to confine wedge, except when diagonal connects.
   - Each side to confine wedge, except when diagonal connects.
   - Each side to confine wedge, except when diagonal connects.

8. Half Gussets at Top:
   - One side if header is the same size as post, except where header is supported slab is badly saturated concrete or masonry, larger.
   - One side if header is the same size as post, except where header is supported slab is badly saturated concrete or masonry, larger.
   - One side if header is the same size as post, except where header is supported slab is badly saturated concrete or masonry, larger.
   - One side if header is the same size as post, except where header is supported slab is badly saturated concrete or masonry, larger.

9. Mid-Point Braces:
   - Use 1x6 or 5/8” min plywood x 6”. 5-8d to each post.
   - Use 1x6 or 5/8” min plywood x 6”. 5-8d to each post.
   - Use 1x6 or 5/8” min plywood x 6”. 5-8d to each post.
   - Use 1x6 or 5/8” min plywood x 6”. 5-8d to each post.

10. Diagonal X Braces:
    - May use 2 layers of 18”x18”x3/4” plywood.
    - May use 2 layers of 18”x18”x3/4” plywood.
    - May use 2 layers of 18”x18”x3/4” plywood.
    - May use 2 layers of 18”x18”x3/4” plywood.
VERTICAL SHORES – ALTERNATE CONFIGURATIONS

This shore is the same as one side of a laced post. It can be partly prefabricated then assembled in danger area.

Material List (see additional information):

- 1 - Header & 1 Sole
- 2 - Wedge Sets
- 2 x Diagonal Bracing
- 4 - Half Cussets
- 4 x Horizontal Bracing
US&R STRUCTURES SPECIALIST FOG
CONSTRUCTING VERTICAL SHORING SYSTEMS

Design Load 6 x 6 posts:
- Height = 12 feet 40,000 lb
- Height = 14 feet 29,000 lb
- Height = 16 feet 24,000 lb

HOW TO CONSTRUCT THE 2-POST VERTICAL SHORE

1. Determine where to erect the 2-Post Vertical Shore, the condition of the supporting structure and/or ground, and remove least amount of debris required to place the shore.
   - If practical, this shore should be partially prefabricated, same as for the Laced Post.
   - If using 4x4 posts, space 4 feet, max on center. 6x6 posts may be 5 feet max on center. If access is limited, Post Spacing may be reduced to 3 feet on center.
   - May build 2-Post Shore in pairs, to later convert two, single 2-post vertical shores into a Laced Post for better stability.

2. Measure and cut the posts to the proper height. (remember to deduct for header, sole & wedges when cutting posts). Also, cut the mid-brace and diagonals to proper lengths.
   - Header shall have a 12 inch overhang each end.
   - Toe-nail posts to header as assembly, first step, then make them square with the header.
   - Nail Half Gussets at posts to header. Make outside edge of half-gusset flush with outside of posts.
   - Nail Mid-Brace to both posts.
   - Nail upper 2x4 diagonal to posts and header.

3. Cut the sole and wedges. Sole is same length as header.

4. Place 2-Post Shore in position, centered under the load.

5. Slide sole plate under shore and tap wedges into position.

6. Check for straightness plus stability, then tighten wedges.

7. Install lower diagonal and half gussets and nail properly.

8. Backing under Sole on Soil:
   - Use 3-2x6x18” under sole centered on each post. (or 2-18”x18”x 3/4” plywood)

9. Anchor the shore to floor above and sole to floor below, if practical.
ADDITIONAL INFORMATION – 2-Post Shore

CONSTRUCTING VERTICAL SHORING SYSTEMS

US&R STRUCTURES SPECIALIST FOG

2-28

Note: Maximum height using 4 x 4 posts is 12 feet.

1. Maximum shore height for 4 x 4 posts: 10 feet.
2. Maximum shore height for 6 x 6 posts: 20 feet.
3. Spacing for 4 x 4 posts: Maximum 4 feet on center.
4. Spacing for 6 x 6 posts: Maximum 6 feet on center.
5. 2 x 4 for 4 x 4 posts.
6. 2 x 6 for 6 x 6 posts.
7. Each side of header is larger than width.
8. Each side of header same size as post except where diagonal.
9. Head Gussets at top:
   • When only one side (2 x 4) wedges at 4 x 4 posts, 2 x 6 or 4 x 6.
10. Head Gussets at bottom:
   • Each side to confine wedges, except where diagonal connects.
   • Each side if header is larger than width.
   • Each side if header is same size as post except where diagonal.
11. Diagonal Braces: (Max. Length is 7’-6”)
   • 2 x 4 for 4 x 4 posts.
   • 2 x 6 for 6 x 6 posts.
12. Mid-Point Braces: (See below for configurations)
   • 2 x 4 for 4 x 4 posts.
   • 2 x 6 for 6 x 6 posts.

Spacing:

- 4’ to 6’ high
- 6’ to 11’
- 11’ to 17’
- 17’ to 20’ high

Maximum shore height for 4 x 4 posts is 12 feet.

<tr>
<td>4 for shore up to 5 feet high</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

High Capacity Laced Post System. It is constructed similar to a pair of 2-post vertical shores, but laced together.
HOW TO CONSTRUCT THE LACED POST SHORE
1. Survey, install spot shores (if needed), and remove the least amount of debris required to place the shore.
2. Determine the length and height of the shore.
   • Cut the header and sole plates 24 inches longer than width of the shore to allow for 12 inch overhangs.
   • Cut the posts to allow for header, sole and wedges.
3. Nail posts to header with toenails and keep them square.
   • Check by comparing diagonal, full-height distances (outside top-right to outside bottom-left, should be same as outside top-left to outside-bottom right).
   • If posts are not straight, set both with bow-out.
   • Nail a half-gusset to one post/header joint, then nail the midpoint brace (braces) in position. Re-check diagonal measurement and pull-in any bow-out.
4. Measure and install the top diagonal, so it overlaps and ties into the header. Use proper nail pattern.
5. Measure and install mid-diagonals, if required by height.
6. Fabricate the second section, using first as template.
7. Have the horizontal tie-in braces precut for ease of assembly.
8. Bring both sections and the sole plates into position and place the prefabricated units on top of the sole plates.
9. Install wedges under each post, and check post spacing.
10. Nail the horizontal braces to the two sections on both sides. Start with the lowest mid-brace and work up.
11. Measure for all the diagonals, and configure in K or parallel layout, as best works for the situation.
   • Avoid intersecting too many diagonals on a post at a single location.
12. At the sole plate, make sure the bottom diagonal extends past the post and nails into the sole plate.
   • Place a half-gusset plate onto the opposite side of this post and to each side of the other posts at the base. (Outside edge flush)
13. Anchor the shore to the ceiling and floor, if practical.
14. Make sure all wedges are snug and the proper nail patterns were used.
ADDITIONAL INFORMATION – LACED POST SHORE

- Maximum shore height for 4 x 4 posts: 17 feet.
- Maximum shore height for 6 x 6 posts: 20 feet.

Note: Maximum height using 4 x 4 posts is 17 feet.
- 4' to 6' high
- 6' to 11' high
- 11' to 17' high
- 17' to 20' high

Additional Information – Laced Post Shore

Design Load: 4 x 4 posts = 32,000 lb
6 x 6 posts = 80,000 lb

- Plywood braced
- High capacity four post system, similar to Std. Laced

Material List:
- 2- each, Header & Sole
- 8- Half gussets
- 2 Dbl gussets
- 4 Posts
- 4 Wedge Sets
- 2- 4 x 48” top/bottom plywood braces
- 8” x 48” mid-braces
- 24” x 48” mid-braces
- 24” x 24” mid-braces

Use 2 sets from 0 ft to 13’.
Use 1 set up to 9’.
Use 1 set up to 9’.
Use 2 sets from 9’ to 13’.
Use 2 sets from 9’ to 13’.
Use 1 set up to 9’.
Use 2 sets from 9’ to 13’.

Only when there are 2 or more sets of braces.

2'-0" max.
2'-0"

High Capacity 4 Post Plywood Laced Post (Vertical Class 3)
HOW TO CONSTRUCT THE 2’ X 4’ PLY LACED POST

1. Survey, install spot shores (if needed), and remove least amount of debris required to place the shore.
2. Determine the height of the shore.
   • Cut the header and sole plates to 4 feet in length. (12” O.hangs)
3. Nail posts to header with toenails and keep them square.
   • Check by comparing diagonal, full-height distances (outside top-right to outside bottom-left, should be same as outside top-left to outside-bottom right).
   • If posts are not straight, set both with bow-out.
   • Nail a double gusset: header to both posts.
   • Nail the plywood mid braces in position. Re-check diagonal measurement, & if posts bow-out, pull them in with the plywood braces. Use proper nail pattern.
4. Fabricate the second section, using first as template.
5. Have the plywood braces precut for ease of assembly.
6. Bring both sections and the sole plates into position and place the prefabricated units on top of the sole plates.
   • Make sure that the prefabricated units are spaced 4 foot out to out, to allow for 4 ft plywood braces.
7. Install wedges under each post, and check post spacing.
8. Nail the plywood braces to the two sections on both sides (start with lower ones and climb up).
9. Nail the top and bottom plywood braces in place.
   • Place a half-gusset plate on each side of each post to sole, with outside edge of gusset flush w/ post outside face.
10. Anchor the shore to the ceiling and floor, if practical.
11. Make sure all wedges are snug and the proper nail patterns were used.
ADDITIONAL INFORMATION - 2' x 4' Plywood Laced Post

- 4' to 9' high: 9' to 13' high

1. Plywood bracing configuration for various heights is shown below.
2. All plywood may be 5/8" or 3/4" (or OSB for dry conditions).
3. Plywood middle braces: 2' x 4', 2' x 2' plywood.
4. Plywood top and bottom braces: 8' x 4' plywood.
5. Double gusset on outside at top; header to both posts.
6. Header and sole: Same size as plywood.
7. Space 2' x 4' level to level.
8. Header and sole spaced 1' x 4' between posts.
10. Maximum shore height for 4' x 4' posts: 13' feet.

- 4' to 9' high:
  - Maximum shore height for 4' x 4' posts: 13' feet.
- 9' to 13' high:
  - Maximum shore height for 4' x 4' posts: 13' feet.

Maximum shore height for 4' x 4' posts: 13' feet.

Design Load: 4 x 4 posts =32,000 lb  
6 x 6 posts = 80,000 lb

Only when there are 2 or more sets of braces
HOW TO CONSTRUCT THE 4' X 4' PLY LACED POST

1. Survey, install spot shores (if needed), and remove least amount of debris required to place the shore.

2. Determine the height and width of the shore.
   - Cut the header and sole plates to 6 feet in length (12" O-hangs).

3. Nail posts to header with toenails and keep them square.
   - Check by comparing diagonal full-height distances (outside top-left to outside bottom-right, should be same as outside top-right to outside bottom-left).
   - If posts are not straight, set both with bow-out.

4. Fabricate the second section, using first as template.
   - Make sure that the prefabricated units are spaced 4 foot out to outside of sole planks.

5. Have the plywood braces pre-cut for ease of assembly.

6. Bring both sections and the sole plates into position and place prefabricated units on top of the sole plates.
   - Make sure that the prefabricated units are spaced 4 foot out to 4 ft plywood braces.

7. Nail the plywood braces under each post, and check post spacing.
   - Only allow for 4 ft plywood braces.

8. Nail the plywood braces to the two sections on both sides (short measurement: 6 ft posts, bow-out, pull trim in with the plywood)
   - Nail the plywood mid-braces in position. Re-check diagonal measurement to ensure bow-out.

9. Install wedges under each post, and check post spacing.
   - Use proper nail pattern.

10. Nail the plywood braces to the two sections on both sides (start with lower ones and climb out).

11. Nail the top and bottom plywood braces in place.
   - Place a half-gusset plate on each side of each post to sole.
ADDITIONAL INFORMATION – 4’x4’ Plywood Laced Post

1. Maximum shore height for 4 x 4 posts: 17 feet.
2. Maximum shore height for 6 x 6 posts: 17 feet.
3. Posts: 4 x 4 and 6 x 6 are spaced the same.
   - Space 4 foot x 4 foot out to out (to match plywood).
4. Header and Sole: same size as posts.
5. Half Gusset on outside at top for each post.
6. Half Gussets each side each post at bottom.
7. Plywood top and bottom braces: 8” x 48” plywood.
8. Plywood middle braces: 24” x 48” plywood.
   - Distance from top or bottom of shore to nearest middle brace for 9 ft to 17 ft heights shall be 2’-0” maximum.
   - There shall be a middle brace placed, centered at the half-height of the shore for 13 ft to 17 ft heights.
9. All plywood may be 5/8” or 3/4” (or OSB for dry conditions).
10. Plywood bracing configuration for various heights is shown below:
SLOPED FLOOR SHORE–TYPE 2 (Vertical/Class 3)

Design Load (depends on slope): 4x4 Posts = 24,000 lb Max.
6x6 Posts = 60,000 lb Max.

Built in pairs similar to a laced post shore. Used to support damaged and sloped concrete floors that are still connected to remaining structure. (Hinging slabs)

Material List:
- 2 Headers & Soles
- 8 Half Gussets
- 4 Posts
- 4-2x cleats x 18" long, 11-16d
- 4 - Diagonal braces (1 each side each shore)
- Anchor Soles w/ 4-1/2 x 8 drill-in anchors into concrete or 4 - 1" dia. X 36" pickets.
- 4 - Headers & Soles
- 8 - Half Gussets

Bracing between shores: see bottom of Pg 2-40

Max. Slope = 45 deg.

See Note 3, Pg 2-41

Foot only at soil bearing.
US&R STRUCTURES SPECIALIST FOG
CONSTRUCTING VERTICAL SHORING SYSTEMS

HOW TO CONSTRUCT SLOPED FLOOR SHORE–TYPE 2
(May be constructed on Paving or on Soil)

1. Survey, install spot shores (if needed), and remove least amount of debris required to place the shore.
2. Determine length and width of shore and post locations.
   • Header overhang is 12 inch maximum. Sole must extend 30" longer from front of longer post, to allow for cleat & anchors.
   • Shore is built as pair of 2-post sections, like laced post.
   • The 2 sections should be placed from 4 ft to 8 ft on center
3. Cut and install the headers and soles.
   • If shore is installed on soil, the standard 18" x 18" foot should be placed under sole at each post. (3-2x6x18" or 2-layers 3/4" ply)
4. Measure and install the two posts at each section.
   • Make angle and return cuts similar to rakers.
   • Toe-nail posts to headers, and drive bottoms of posts tight and toe-nail. (no wedges, since they get in the way of the braces)
5. Install bottom cleats tight against each post.
6. Anchor the sole plates, as follows:
   • Anchor sole using drilled-in anchors into concrete, or 1"dia. X 36" pickets to anchor to paving or soil, based on Structures Spec. recommendations. (2 minimum per 2-post section).
   • See page 3-9 for alternate Sole Plate Anchor system.
7. Measure for diagonal braces inside and outside each section.
8. Install 2x6 diagonal braces in position and nail to posts, headers and sole plates. (may use 3-16d into posts to limit splitting)
   • Cleat/Half Gusset plate the opposite side of the posts, top and bottom, using the 4 and 4 nail pattern.
   • Need to place Half Gussets to clear the horizontal and diagonal braces (to be installed next), or use 2x cleats instead of gussets.
9. Tie the two sections together, same as in Laced Posts. (See Additional Information for alternatives).
   • Ties are placed between posts at the taller and the shorter ends of each shore section.
   • Use a wide piece of 5/8" or 3/4" plywood (12" to 24" wide) if short end of shore is too short to fit X braces.
   • The plywood or 2x6 bracing may be installed on the inside of the shorter posts, if that is easier.
10. Attach to the floor and ceiling. (If possible).
ADDITIONAL INFORMATION – Type 2 & 3 Sloped Fl. Shores

1. Posts: (Max. length = 8ft for 4 x 4 & 12ft for 6 x 6, if greater height is needed, build shore like Laced Post. See pg 2-41)
   - Spacing for 4 x 4 posts: Maximum 4 feet on center.
   - Spacing for 6 x 6 posts: Maximum 5 feet on center.
   - Spacing between shores as pairs: 4 ft to 8 ft on center.

2. Header and Sole: same size as posts.

3. Half Gussets: on opposite sides of diagonals, top & bottom.

4. Diagonal Braces: (2 x 6 x 18") placed under each post.

5. Soil Support: (18" x 18" foot at soil bearings only)

6. May directly anchor sole with 2 – 1½" x 8½" wedge anchors or placed under each post.

7. Alternate Sole Anchor: see Section 3 for details.
   - 4 x 4 or 6 (preferred) spaced shores + 4.
   - 4 x 4 or 6 (preferred) spaced shores + 4.
   - 4 or more 1" diameter x 36" long pickets.

8. Bracing/lacing between shores:
   - Built in Pairs and Braced/laced Together.
   - Built in Groups (4 each min to 8 feet max on center).
   - Built in One „Diagonal“ x 46“ Long Pickets.

   - 2 x 4 or 4 x 4 Wedges at each shore.
   - 3 - 2 x 6 x 18" (flat) or 2 - 1½" x 18" x 3/4" plywood layers.

   - Horizontal Plywood braces: 5/8" or 3/4" x 12" (min), where

   - Horizontal Diagonals are 2 x 6 (Z - 2 x 4 alternate)

   - Bracing between shores: (all are Z6)

   - 4 or more „Diagonal“ x 46“ Long Pickets.

   - Alternate Sole Anchor: see Section 3 for details.

   - 4 x 4 or 6 (preferred) spaced shores + 4.

   - 4 or more 1" diameter x 36" long pickets.

   - Built in Pairs and Braced/laced Together.

   - Built in Groups (4 feet min to 8 feet max on center).

   - Horizontal & Diagonals are 2 x 6 (2 - 2 x 4 alternate).

   - Horizontal Plywood Braces: 5/8" or 3/4" x 12" (min). where

   - Height is 3 ft or less, 1½-post each end.
US&R STRUCTURES SPECIALIST FOG
CONSTRUCTING VERTICAL SHORING SYSTEMS

ALTERNATE METHODS for building VERTICAL SHORES

1. **Shoring Lumber**: If No 1 Douglas Fir is not available
   - Use S. Pine, Hem-Fir or Spruce-Pine-Fir, at 85% Design Load
   - Also may use Eastern Softwoods, Western Cedar, & Western Woods, by reducing the Design Load to 75%
   - This applies to 1x4, 2x4, 2x6, 4x4, and 6x6 lumber.
   - May use 19/32 CDX plywood or Oriented Strand Board (OSB)

2. If 4 x 4 lumber IS NOT available, may use 3-2x4s:
   - For Posts, Headers, & Soles in Vertical, Sloped Fl, & Window Shores, **each 2x4 must be full length**.
   - Nail 3-2x4s together with 16d sinker/cooler @ 5"o.c. stagger. thus: from each side. (.148 x 3.25" coated nails)
   - If using 8ft long (3-2x4) for Raker Wall & Sole Plates: stagger all joints by 2ft min, and locate only one joint in any location.
     - 12ft long example:

   3. **Sloped Floor Shore Special Notes**:
   - If taller than 8ft for 4x4 & 12ft for 6x6 Posts:
     - Add mid-point bracing and sets of diagonals same as for Laced Posts. See page 2-30.
     - Post spacing is 4ft o.c. for 4x4 and 5ft o.c. for 6x6.
     - Maximum height is 12ft for 4x4 and 16ft for 6x6.
   - If slope of structure is greater than 45 deg., build shores to be more like Rakers, spaced at 4ft o.c.
   - Provide mid-brace if Raker/Post is more than 8ft long.
   - Consult Struct Spec. for cleat nailing & sole anchors.
SLOPED FLOOR SHORE–Type 3 (Vertical/Class 3)

Foot only at soil bearing.

Design Load (depends on slope): 4x4 Posts = 24,000lb Max.
6x6 Posts = 60,000lb Max.

(Consult Structures Specialist) Foot only at soil bearing.

Max. Slope = 45 deg.

Material List:
- 2 Headers & Soles
- 8 Half Gussets
- 4 Posts
- 4 2x18 11-16d
- 4 Wedge Sets (Optional)
- 4 - 1/2" drill-in anchors
- Sole Anchor from 4 x 4 / 6 x 6 w/ 4 - 1" dia. X 36" pickets
- 4 - Diagonal braces (1 each side each shore)

Support concrete floors that are not connected to remaining structures and may slide.
Built in pairs similar to Type 2 Sloped Floor Shore.

Max. Slope = 45 deg.

See Note 3, Pg 2-41
HOW TO CONSTRUCT SLOPED FLOOR SHORE–TYPE 3

1. Survey, install spot shores (if needed), and remove debris.
2. Determine length and width of shore and post locations.
   - Shore is built as pair of 2-post sections, like laced post.
   - The 2 sections should be placed from 4 ft to 8 ft on center
   - Header overhang is 12 inches on shorter end, but should be increased to 30" at higher end for cleat and anchors. Sole plates should extend 12 inches beyond each post.
   - Install headers and sole plates, and anchor header.
   - If shore is installed on soil, the standard 18" x 18" foot should be placed under the sole at each post.
   - Prepare to install one, 18 inch cleat, for each post on underside of header (pre-install as many as possible cleats on header w/ 11-16d nails, to reduce nailing in Collapse Zone).
3. Measure, angle/return cut, and install the two posts for each section; toe-nail to header, then drive posts tight and plumb. **Wedges are optional**, but may be used as with vertical shores.
4. Make sure posts are plumb, and install remaining 18" top cleats.
5. Attached header to ceiling/slab bottom with 2 - 1/2" x 8 ½" wedge anch., or ½" rebar/plain bar x 8" min. (embed at least 4")
6. Anchor the sole plate, and re-check/re-drive the post tight.
7. Measure for the diag. braces inside/outside of each section.
8. Install 2x6 diagonal braces in position and nail to posts, header, and sole plate. (may use 3-16d into posts to limit splitting)
   - Place Half-Gusset plate the opposite side of the posts, top and bottom, and complete gusset nailing – 4 & 4, 8d.
   - **Note:** Half-Gussets may be installed with posts – partly nailed.
   - Need to place Half-Gussets to clear the horizontal and diagonal braces (to be installed next) -
9. Tie the two sections together, same as in Laced Posts. (See Additional Information for alternatives).
   - Ties are placed between posts at the taller and the shorter ends of each shore section.
   - Use a wide piece of 5/8" or 3/4" plywood (12" to 24" wide) if short end of shore is too short to fit X braces.
   - The plywood or 2x6 bracing may be installed on the inside of the shorter posts, if that is easier.
10. Attached to the floor and ceiling. (If possible).
Cribbing (Vertical/Class 3)

Material List:
- Depends on height, number of pieces per layer, and the height of each piece. See configurations below.
- Different cribbing rules occur at different bearings.
- Amount of deflection due to cribbing, especially when amount of deflection due to cribbing, especially when different crushing rates occur at different bearings.

CRIBBING (Vertical/Class 3)
CONSTRUCTING VERTICAL SHORING SYSTEMS
USER STRUCTURES SPECIALIST FOE
HOW TO CONSTRUCT CRIBBING

1. Survey, install spot shores (if needed), and remove debris.
2. Determine where Spot Shores should be built in order to quickly reduce risk.
3. Determine overall height of area to be shored and remove least amount of debris required to place shore.
4. Determine the desired width dimensions of the crib.
5. Determine the size of the members to be used, and the configuration of the crib layers.
   - Use 6x6 members if crib needs to be more than 4 ft high.
   - Note that the 3-member x 3-member configuration is more than 2 times as strong as 2-member x 2-member.
6. Decide if the first layer needs to be a solid layer, depending on the type of bearing material. (soil or other surface softer than a concrete slab.
   - If the supporting surface is concrete, make sure that it has the required stiffness and capacity, and there is not a basement story below.
7. Carefully slide the members in for each layer, and keep the crib aligned and as square as possible.
8. When the crib reaches required height, add shims to make sure that all intersections of crib members are in solid contact with the supported structure.
9. Attach the crib to the supporting surface (or confine its movement), if practical.
10. Where vibration and aftershocks may occur, interconnect the crib layers with 3/8" min x 16" long plywood strips that are 1.5 times as high as the cribbing members.
   - The plywood strips need to be placed on all 4 sides of the crib.
   - Nail plywood strips at top and bottom edges to crib members with 8d at 3 inches on center as shown below:
ADDITIONAL INFORMATION - Cribbing

1. Height: Max. Ratio, Ht to Width = 3 x shortest width.

2. Overlap corners by at least 4 inches.

3. Solid bottom layer for soil or asphalt applications.

4. Design load basis:

   - psf – Use 500 psf for No. 1 & Better Douglas Fir.
   - Cross-grain bearing of the wood (varies from 200 psf to 1,000 psi).

5. Recommended max. height for 4x4 systems is 4 feet.

6. Recommended max. height for 6x6 systems is 10 feet.

7. Height: Max. Ratio, Ht to Width = 3 x shortest width.

   - Design load formula: L = A x N x P
   - Number of Bearing Points
   - Load per Bearing Point
   - Allowable bearing pressure (psf)
   - Area of single bearing point (sq. in.)

   - Load = L
   - A = Area
   - N = Number
   - P = Pressure

9. For Eastern Softwoods, Western Cedar, & Western Woods, use 75% of these Design Loads.

10. For Southern Yellow Pine, Hem-Fir, & Spruce-Pine-Fir, use 85% of these Design Loads.

11. Recommended max. height for 4x4 systems is 4 feet.

12. Recommended max. height for 6x6 systems is 6 feet.

   - Design Load for 4x4 No. 1 Douglas Fir.
   - 2 member x 2 member system = 24,000 lbs
   - 3 member x 3 member system = 54,000 lbs

13. Design Load for 6x6 No. 1 Douglas Fir.

   - 2 member x 2 member system = 60,000 lbs
   - 3 member x 3 member system = 135,000 lbs

14. For Southern Yellow Pine, Hem-Fir, & Spruce-Pine-Fir, use 85% of these Design Loads.

15. For Eastern Softwoods, Western Cedar, & Western Woods, use 75% of these Design Loads.
**CRIBBING at SLOPED FLOOR (Vertical/Class 3)**

Cribbing can be built under a concrete sloped floor. Wedges and shims should be added to each layer in order to achieve the slope gradually. The Max. Slope should be 30% off the horizontal (about 15 deg). The Max. Height should be 4ft when using 4x4 lumber, and 6ft for when using 6x6 lumber.

<table>
<thead>
<tr>
<th>Material List:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Depends on height, number of pieces per layer and the height of each piece. See configurations below.</td>
</tr>
</tbody>
</table>

![Diagram of cribbing on a sloped floor](image)
Design Load: 4x4 Header = 2,000 lb  6x6 = 6,000 lb

This shore is used in URM buildings to support loose masonry over openings. May be used in other buildings where door/window headers are damaged.

Material List:
- 2-4 Headers
- 1-4 Cleats
- 4-4 Wedge Sets
- Shims as required
- 2 Posts
- 1 Half Gusset
- 2 - 2 x 4 (if not used for access)

Diagonal braces 2 - 2 x 4 (if not used for access)

WEDGE VALUE SHEET (Vertical/Class 2)
HOW TO CONSTRUCT THE WINDOW/DOOR SHORE

1. Survey, remove finishes (if required), and remove debris.
2. Measure and cut the sole plate and header to the proper length deducting the width of the wedges to be used.
3. Make header 1” deep for every foot of opening; 4x4 min.
4. Have StS design header for opening over 4ft wide.
5. Measure and cut the posts to the proper height.
   - Place the header on top of the sole plate.
   - To determine post height, place the end of the tape measure on top of the header where the posts are to be installed, slide the tape up to the bottom of the structural element to be shored deducting the thickness of the wedges to be used. (Use the shorter of the two measurements).
6. Install the sole with a set of wedges at one end and tap them together simultaneously until the sole is tight.
7. The sole should be as level as possible: use shims as necessary under the sole plate.
8. Install the header with a set of wedges at the opposite end of the sole and tap them together until the header is tight.
9. The header should be as level as possible; use shims as necessary above the header.
10. Install the posts between the header and sole, and against the sides of the opening.
11. Install the first post under the wedge side of the header to prevent movement if the header wedges loosen.
12. Keep posts in line and plumb with header and sole.
13. Install a wedge set under each post, on top of the sole. Wedges are then tightened to lock shore in place.
14. Attach cleat and half-gusset to at least one side of the header and posts and nail in place.
15. Confine the wedges by placing a cleat against the inside face of each post at the bottom and nail them in place with 3-16d nails to each post and 2-16d toe nails to the sole.
   - May use duplex nails for future adjustment of the wedges.
PRE-CONSTRUCTED SHORING SYSTEMS

1. Window/Door Shores may be pre-constructed as shown in Prefabricated Window/Door Shore (next page).

   - They should be made at least 1 ½" less than opening in each direction, and then tightened with wedges at one side and bottom + shims as required.
   - If header is badly damaged, great care should be taken during installation of the shoring and shims. Shims should be made at least 1 ½" less than opening in each direction, and then tightened with wedges at one side and bottom + shims as required.
   - If header is badly damaged, great care should be taken during installation of the shoring and shims. Shims should be made at least 1 ½" less than opening in each direction, and then tightened with wedges at one side and bottom + shims as required.

   - If header is badly damaged, great care should be taken during installation of the shoring and shims. Shims should be made at least 1 ½" less than opening in each direction, and then tightened with wedges at one side and bottom + shims as required.
   - If header is badly damaged, great care should be taken during installation of the shoring and shims. Shims should be made at least 1 ½" less than opening in each direction, and then tightened with wedges at one side and bottom + shims as required.

   - If header is badly damaged, great care should be taken during installation of the shoring and shims. Shims should be made at least 1 ½" less than opening in each direction, and then tightened with wedges at one side and bottom + shims as required.

   - WARNING – The use of Air Pressure to raise these constructed vertical shores should be avoided. If header is badly damaged, great care should be taken during installation of the shoring and shims. Shims should be made at least 1 ½" less than opening in each direction, and then tightened with wedges at one side and bottom + shims as required.

   - Pneumatic shores are best used as temporary shores.
   - Metal ends should be nailed to header and sole.

2. Pneumatic Shores, with a minimum of two shores with wood or metal rail header (see page following All Window Shore)
US&R STRUCTURES SPECIALIST FOG
CONSTRUCTING VERTICAL SHORING SYSTEMS

PREFABRICATED WINDOW/DOOR SHORE

Alternate to built in-place Window/Door Shore. Main advantage is to allow pre-construction a safe distance from the collapse zone. Also the shore can be reused.

Material List:

<table>
<thead>
<tr>
<th>Item</th>
<th>Quantity</th>
</tr>
</thead>
<tbody>
<tr>
<td>Header and Sole</td>
<td>4 - Wedge Sets</td>
</tr>
<tr>
<td>2 - Posts</td>
<td>8 - Half Gussets</td>
</tr>
</tbody>
</table>

Design Load: 4x4 Header = 2,000 lb  6x6 = 6000lb
HOW TO CONSTRUCT THE PREFAB. WINDOW/DOOR SHORE

1. Survey, remove finishes (if required), and remove debris.

2. Measure opening and check to see if it is square or racked.

3. Measure opening and check to see if it is square or racked.

4. Measure and cut post. Length should allow for the thickness of the header and door/window side.

5. Place one half gusset from each post to header and to sole.

6. Turn shore over and place a half gusset on opposite side of sole.

7. Carry shore to opening and install one wedge set under the sole.

8. Install one wedge set between header and door/window side.

9. Install one wedge set between sole and door/window side.

10. Place shims between top of header and top edge of opening at mid-span and as required for adequate support.

PREVIOUSLY INSTALLED GUSSETS

HOW TO CONSTRUCT THE PREFAB. WINDOW/DOOR SHORE
VERTICAL SHORING USING PNEUMATIC STRUTS

Pneumatic Strut Manufacturers have developed special configurations that may be used to construct Vertical Shores. See following pages for configurations.

1. Struts may be configured as T, Dbl-T, Vertical 2-post and Multi-Post Shores. In addition there are special configurations such as: 3-Post Column, Sloped Floor Shore, Window/Door Shore, and Laced Post Shore.

2. Wood headers are used in most cases, and Wood Soles are needed when the load needs to be spread-out on the structure that is supporting the shore.

3. The standard Pneumatic Shore Base Plates may be used when shore in bearing on an adequate concrete slab. Consult qualified Structures Specialist.

4. The Design Load of these shores may be determined by knowing the height and number of struts that are used. The Strut Load Tables are shown in Sect 4 of SOG & Sect 7 of FOG. Consult qualified Structures Specialist, since other factors such as header or sole strength may govern the shore capacity.

5. Low pressure air (50psi max) may be used to extend the struts, but care must be taken to not impact the structure.

6. Use hand tightening to snug-up all joints.
US&R STRUCTURES SPECIALIST FOG
CONSTRUCTING VERTICAL SHORING SYSTEMS

2-56

PNEUMATIC T-SHORE
Temporary, Spot Shore that is relatively unstable. The load must be centered on the post. Design load should be no more than 4,000lb.

DBL-T SHORE
Uses 2 - Struts with header and sole. Uses 2 - Struts with header and sole. The load must be centered on the post. Design load should be no more than 4,000lb.

2-56

CONSTRUCTING VERTICAL SHORING SYSTEMS
US&R STRUCTURES SPECIALIST FOG
VERTICAL SHORE
Use 3 or more struts with header, sole and X-bracing as shown.

Design Load may be based on the length of the struts as given in the table in Sect 7.

2-POST VERTICAL SHORE
Use 2 vertical struts, plus a diagonal strut that must be configured to resist both tension & compression.
US&R STRUCTURES SPECIALIST FOG
CONSTRUCTING VERTICAL SHORING SYSTEMS

2-58

3-STRUT COLUMN
Uses 3 pneumatic struts with specially manufactured cap and foot. Cap and base may need wood cribbing or multi-layers of plywood to spread the load. Design load is limited. Shore Design Load may be based on the length of the struts as given in the table in Section 7.

SLOPED FLOOR SHORE
Uses a minimum of 2 pneumatic struts, and is a Temporary, Spot Shore. Design Load is limited, and is only viable if the supported slab remains connected to the structure. Load needs to be kept from the slab by bases.

To be kept from the slab by bases. Use a minimum of 2.
WINDOW OR DOOR SHORE
This shore uses 2-pneumatic struts with wood header / sole. It would be used as a temporary shore when wood posts were not available.

Shore capacity would be based on the size and strength of the wood header.
A qualified Structures Specialist should be consulted if a Design Load of more than 2,000lb is needed to support the opening.
US&R STRUCTURES SPECIALIST FOG

CONSTRUCTING VERTICAL SHORING SYSTEMS

LACED POST SHORE

This shore uses 4 pneumatic struts with wood header.

Each strut will need a metal, manufactured base.

This shore should only be used when it is specified and supervised by a qualified Structures Specialist, and she or he should determine the Design Load.

All horizontal and diagonal members must be special struts that are capable of resisting tension and compression.

4x6 wood or steel tube headers.
INTRODUCTION to SECTION 3

This section contains General Information, Graphics and Detailed Explanations of how to construct FEMA Raker and Horizontal Shoring – arranged as follows:

- Raker Shore – General Information
  - Types of Rakers page 3-2
  - Raker Cleats & Gussets 3-3
  - How to determine Raker Angle & Length 3-4
  - Raker Shore Bracing 3-6
  - Backing for Rakers at Special Walls, & Raker Splice 3-8
  - Trough Base and Sole Anchor 3-9
  - Use of Framing Square 3-10

- How to construct Raker Shores 3-11
  - Flying Raker – Spot Shore 3-12
  - Raker with backing for Wood or Masonry Walls 3-15
  - Solid Sole Raker 3-16
  - Split Sole Raker 3-20
  - Double Raker 3-23
  - Alternate – Using 3-2x4 studs to build Rakers 3-25

- How to construct Horizontal Shores 3-26
- Tiebacks and Alternate Raker Systems 3-29
- Pneumatic Strut Systems: Horizontal & Raker Shores 3-31

Note: See Sect 2 for Size-up, and General Information and Shoring Details.
Raker Shores: General Information

Description:
Used in search and rescue incidents to stabilize leaning and/or damaged walls. There are 3 types: Flying, Solid Sole, and Split Sole. All have unique characteristics.
Used in search and rescue incidents to stabilize leaning walls.

Material List: See each individual system.
RAKER SHORES: GENERAL INFORMATION

1. Raker Shores may be built in a progression, starting with Flying Raker, to stabilize the wall, followed by a group of Full Triangle Rakers (Since Full Triangle Rakers are mostly pre-fabricated, they may be installed without first installing Flying Rakers).

2. **Top Cleat for 4 x 4 Raker**:
   - 24 inches with 14 – 16d nails for 45 degree rakers.
   - 30 inches with 20 - 16d nails for 60 degree rakers.

3. **Top Cleat for 6 x 6 Raker**:
   - 24 inches with 20 – 16d nails for 45 degree rakers.
   - 30 inches with 29 - 16d nails for 60 degree rakers.

4. **Bottom Cleat**:
   - 24 inches with 14 – 16d nails for 4 x 4 rakers.
   - 24 inches with 20 - 16d nails for 6 x 6 rakers.

5. **Plywood gussets**: 5/8" or 3/4" (OSB if not wet area).

6. **Sole Anchor**: All rakers need a Sole Anchor. (shown later)
DETERMINING RAKER SHORE ANGLE & LENGTH

1. Any angle between 30 and 60 degrees will work effectively.
   - The lower the angle, the more efficient the raker will be.
2. The two most common angles used are 45 and 60 degrees. A 60 degree angle is the maximum recommended angle used to shore support points in feet multiplied by 1.7 will give the length of the raker shore. A 45 degree angle raker shore requires longer lumber than a 60 degree raker.
3. Determining the height at which the raker shore needs to intersect the wall (Insertion Point) will identify the angle to work best with the available lengths of lumber. The Insertion Point for a Wood Bldg should be between the top of the Floor Joist and 2 feet below that point.
4. The length of a 45 degree angle raker shore: Height of the raker shore support point in feet multiplied by 17 will give the length of the raker, tip to tip, in inches. (8’ X 17 = 136” or 11’ 4”).
5. The length of a 60 degree angle raker shore: Height of the raker shore support point in feet multiplied by 14 will give the length of the raker, tip to tip, in inches. (8’ X 14 = 112” or 9’ 4”).

</tbody>
</table>

Vertical force from Raker trends to cause Wall Plate to move up the wall. Need to anchor Raker to wall with Steel Bar Anchors, or bear part of wall plate on existing wall projection.

**FORCES in Raker Shores**

**Insertion Point**

Horizontal force from Raker trends to keep wall/bldg from moving.

Vertical force from Raker must be resisted by Sole Anchor, or Steel Pickets.

Horizontal force from Raker must be resisted Paving, or special foot on soil.
Raker Shores: Multi-Shore Bracing, Backing, Anchoring

<table>
<thead>
<tr>
<th>Splice Horizontal Brace/ Half Gusset</th>
</tr>
</thead>
</table>

- Only need middle horizontal brace if raker has a mid-brace.

This is an example of a four raker system, when the rakers have a mid-brace. X bracing is shown, but V bracing may be used. Normally the X bracing should be installed between the end pair of rakers. X bracing should be no more than 40 feet on center.

Materials List: See each individual system.
- Trough base and sole anchors
- Backing against well and raker splice
- Bracing between rakers

Most all raker installations have multiple numbers of rakers.
US&R STRUCTURES SPECIALIST FOG
CONSTRUCTING LATERAL SHORING SYSTEMS

BRACING BETWEEN RAKERS
1. Rakers are normally spaced at 8 feet on center maximum. However, actual conditions may require closer spacing.
2. Lateral Bracing between rakers is normally built using 2x6 horizontals and X-bracing.
3. Depending on height of insertion point, rakers may have mid-bracing to reduce to potential of buckling. In this case the lateral bracing will have a horizontal placed near the intersection of mid-brace and raker, and there will be two levels of X-bracing.
4. Horizontal Bracing: 2 x 6 or 2-2x4.
   • Butt splice at center of raker. Preferred if 16ft long.
   • 3 – 16d nails at each horizontal brace to each raker.
   • Cover each splice with Half Gusset, 8-8d.

5. Middle Horizontal Bracing: (If raker has mid-point brace).
   • 4 x 4 raker: required if length of raker > 11 feet.
   • 6 x 6 raker: required if length of raker > 16 feet.
6. Diagonal Bracing
   • “X” bracing: Use 2 x 6 or 2-2x4 (side by side). Allow no more than 32 ft (4 bays) between bracing bays. 5-16d each end each brace, and where they cross. (X-bracing 40 ft max o.c.)
   • “V” bracing: Same as “X” bracing, but one member of the “X” is placed on the next bay. Allow no more than three un-braced bays between a “V” brace. (40 ft max. o.c.)
BACKING for RAKERS at SPECIAL WALLS (see page 3-15)

1. For concrete or masonry walls, spreaders may be needed between wall plate and wall if wall is badly cracked.

   - Alternate 1: 1 piece of plywood, 4 ft x 4 ft x 3/4", with the top at the insertion point, and centered (left to right) on the wall plate. Nail plywood to wall plate with 16-16d nails.

   - Alternate 2: Use full 4 ft x 8 ft sheet of plywood with the long direction placed vertically. Nail plywood to wall plate with 16-16d nails.

   - Alternate 3: Use 2 sheets of 5/8" or 1/2" plywood. For Alt 1 & 2 if thicker ply is not available. Same nailing.

2. For wood walls, place a 2 ft high x 3 ft wide x 3/4" or 5/8" sheet of plywood centered on the wall plate, with the top near the insertion point, and/or the floor/roof line of the structure. Nail plywood to wall plate with 16-16d nails, equally spaced.

   - Center raker on a stud, and nail backing into studs and edge of plywood.

   - Nail backing plywood to wall plate with 16-16d nails, equally spaced.

   - Center raker on a stud, and nail backing into studs and edge of plywood.

   - Nail backing plywood to wall plate with 16-16d nails, equally spaced.

RAKER SPlice

1. Locate center of splice within one foot each side of where mid-point brace connects to raker.

2. Splice should be prefabricated on raker prior to assembling the raker shore.

   - 5/8" or 3/4" x 36" ply each side of center of splice

CONSTRUCTING LATERAL SHORING SYSTEMS

USER SHORING OPERATIONS GUIDE
TROUGH BASE
1. Used as base for Split Sole and Flying/Friction Raker.
2. Place 18" x 18" foot under Trough for bearing on soil.

<table>

</tr>
</tbody>
</table>

SOLE ANCHORS
3. Keeps rakers from moving away from wall. Length = 4ft min
   - **Pickets** are 1" dia. x 36" min., Grade A-36 plain steel rods or Grade 60 rebar, driven a minimum of 24" into soil or paving.
   - Use 4 x 4 or 6 x 6 with at least 2 pickets placed in pre-drilled holes through-it if high winds or aftershocks are possible.
   - Pickets may be placed behind in other conditions, however the pre-drilled timber can act to guide pickets and keep them plumb.
   - Use 2 x 4 or 4 x 4 wedges. May use 2 x 6 wedges against 6 x 6.
   - **Pickets per raker**: Use 3 into Paving & 6 into Cohesive Soil.
   - **Cohesionless soils** (sands) Don't adequately support Pickets.

It can be erected next to a wall without removing debris.

Rapidly installed shore that is best used as an initial
shore until a more reliable raker system can be installed.

3-12 US&R SHORING OPERATIONS GUIDE

CONSTRUCTING LATERAL SHORING SYSTEMS
HOW TO CONSTRUCT THE FLYING RAKER

1. The area adjacent to where walls need support by rakers should be considered as very hazardous. Pre-construct each Flying Raker beyond the fall zone, and do not attempt to remove any debris that has fallen next to the damaged wall.

2. Determine where to erect the Flying Raker and the height required to support the wall. Determine height of Insertion Point.
   - Flying Rakers may be used as single, spot shores, or may be built in pairs with horizontal & X bracing between them.

3. Flying Raker order of construction outline is as follows:
   - In order to pre-fabricate, Cut Raker, Wall Plate and Bottom Brace to proper length, and perform angle cuts on Raker.
   - Prefabricate the Shore, Trough Base, & Anchor. (page 3-9)
   - Fit the shore into the Trough Base.
   - Place the Anchor for the Trough.
   - Install wedge and/or shims.
   - Attach to wall with 1/2” drill-in anchors (or nails for wood walls).
   - Retighten the wedges.

4. Layout Wall Plate, Raker and Bottom Brace at selected angle, and toe-nail Raker to Wall Plate. (60 or 45 degree angle OK)

5. Nail-on Top Cleat, then gusset to one side of this joint.

6. Nail one-Bottom Brace to Wall Plate in position to clear debris, but only tack-nail it to Raker.

7. Turn shore over and nail-on other gusset plus other Bottom Brace. (nailed to Wall Plate, tack to Raker)

8. Anchor the Trough, then carry the partly assembled Raker into place. Snug-up the Wedges, and complete the nailing of Bottom Brace to Raker. See page 3-9 for sole anchor.

9. Make whatever connection to wall that is selected, see ADDITIONAL INFORMATION.

10. Retighten the Wedges.

3-13
ADDITIONAL INFORMATION

1. The areas to be supported by Raker Shores should be considered extremely dangerous.

2. They may be used as single spot shores, or may be built in pairs with horizontal and X bracing added between pairs.

3. To attach wall plate directly to concrete/masonry wall use 1/2" drill-in anchors as noted below:
   - Place a minimum of two 1/2" x 8 ½" wedge anchors, or 1/2" x 8" long rebars/smooth bars (4" min embed in wall) through raker.
   - Place a minimum of two 1/2" x 8 ½" wedge anchors, or 1/2" x 8" long rebars/smooth bars (4" min embed in wall) through raker.
   - Center raker on a stud, and use at least 8-16d nails through backing material into studs and/or edge of window. With a single or double 2x4 (2½" min W/14-lb. drywall) attach to wall plate using at least 12-16d nails, and use at least two 1½" long rebars/smooth bars (4" min embed in wall) through raker.

4. To attach the wall plate directly to a wood framed wall:
   - Use 2 ft high x 3 ft wide x 3/4" or 5/8" ply backing nailed with 16-16d nails to the wall plate. Center raker on a stud, and use at least 8-16d nails through backing material into stud and edge of window.
   - Use 2 ft high x 3 ft wide x 3/4" or 5/8" ply backing nailed with 16-16d nails to the wall plate. Center raker on a stud, and use at least 8-16d nails through backing material into stud and edge of window.

5. In some cases the drill-ins may be omitted if the top of the wall, floor, or side of raker:
   - 1½" nails through the backing material into studs and/or edge of window. With a single or double 2x4 (2½" min W/14-lb. drywall) attach to wall plate using at least 12-16d nails, and use at least two 1½" long rebars/smooth bars (4" min embed in wall) through raker.

6. Al brick/concrete wall, raker may be built at one edge of a

US&R STRUCTURES SPECIALIST FOG
CONSTRUCTING LATERAL SHORING SYSTEMS

RAKER BACKING – USED WHEN SUPPORTING WOOD WALLS
See page 3-8 for detail information including nailing.
- The plywood backing shown may be also used with Split Sole and Flying Rakers.
- Plywood is 24" high x 36" wide x 3/4" or 5/8" thick.
- Nail 16-16d from ply into back of wall plate, and 8-16d each side of raker into studs and/or edge of floor.
- The top of the plywood backing should be placed at the Insertion Point. Center Raker on a stud.

Raker Backing – Used when supporting badly cracked Concrete and Masonry Walls
- Plywood is 48" high (minimum) x 48" wide x 3/4" thick.
- Nail 16-16d from ply into back of wall plate.
- Connect Raker to wall using 2 or more 1/2" x 5 ½" wedge anchors, or 1/2" x 8" rebars (or smooth steel bars) through the backing material into the concrete wall (4" min. embed. in wall) on each side of the Raker.
SOLID SOLE RAKER (Lateral/Class 3)

For slopes & retaining walls, see 4x6 Wall Plate.

Material List:
- 1 - Wall Plate
- 2 - 1/2" drill-in wall plate anchors for 45 deg. & 3 anchors for 60 deg.
- 1 - Raker 6 – Full Gussets
- 2 - Mid-point braces 1 – 2 x 4 or 4 x 4 Wedge Set
- 1 - Sole Plate
- 2 - 24" long cleats, 14-16d each for 45 degree rakers
- Top cleat is 30", 20-16d each for 60 deg.
- 2 - 4x4 Wall Plate
- 2 x 6 x 16" or 2 x 8 x 16" for 60 deg.
- 2 - 24" long cleats, 14-16d each for 60 deg.
- Sole Anchors: 3 Pickets into paving, or 6 in cohesive soil.
- Foot at soil support: 3 - 2 x 6 x 16" or 2 x 8 x 16"
- 1 - Sole Plate
- 2 - Mid-point braces 1 – 2 x 4 or 4 x 4 Wedge Set
- 1 - Wall Plate
- 2 - 24" long cleats, 14-16d each for 45 deg.
- 6 - Full Gussets
- 1 - Raker
- 45 deg. 5 x 3 anchors for 60 deg.
- 4 x 4 Wall Plate
- 2 - T/2" drill-in wall plate anchors for 45 deg.
- Material List (per raker – need two or more)

Used in incidents to stabilize leaning or damaged walls. Solid Sole, full triangle, rakers are most desirable, and are built at 45 or 60 deg angle in groups of 2 or more. Solid Sole, full triangle, rakers are most desirable, used in incidents to stabilize leaning or damaged walls.
HOW TO CONSTRUCT A SOLID SOLE RAKER

1. Determine where to erect the raker shores, the height of supported wall, and the height of Insertion Point.
2. If area is not clear of debris, consider Split Sole Raker.
3. Select angle of Raker, then measure and cut the Wall Plate, Sole Plate and Raker to the proper length.
   - Sole and Wall Plate extends at least 30" from where the raker intersects them to allow for the Cleats.
   - Angle-cut ends of raker with 1½ " return cuts for full contact with the wall and sole plates, cleats and wedges.
4. Pre-fabricate Wall Plate, Raker, Sole, and Sole Anchor.
   - Toe-nail Sole to base of Wall Plate, square inside to 90deg, and secure with gusset plate on one side.
   - Layout Raker at selected angle, intersection with Wall Plate and Sole. Anchor to Wall Plate with 16d nail, install top cleat and nail-on gusset one side.
   - Nail one Sole Gusset to Raker, but not to Sole at this time, since Raker may need later adjusting.
   - Mark Sole for position of Bottom Cleat, allowing for Wedges.
   - Flip Raker Shore over and nail gussets on opposite side, but remember to nail the Raker to Sole Gusset, to Raker only, not to Sole to allow for later adjustment.
5. Carefully move the partially prefabricated Rake Shore in place at the wall and make sure it is plumb (side to side).
   - With Raker Shore placed against the wall, the Sole should be carefully driven-in so the Wall Plate is snug against the Wall, and then the Bottom Cleat should be completely nailed, allowing space for the Wedges.
   - Full contact must be maintained between the wall plate and the insertion point as well as at base of wall. (If the wall bulges out, add shims to maintain full contact)
6. After anchoring Sole Plate (see 12.), install wedges between the bottom cleat and base of the Raker and tighten them slightly.
   - After adjusting the shims/spacers (if any) between the wall plate and the wall being shored to ensure full contact, above, finish tightening wedges and complete nailing of gusset on each side.

3-17
7. With Raker shore erected, prevent the Raker shore from sliding up the wall, using a minimum of 2-1/2" drill-in anchors with 4" min. embed in wall or other methods. See ADDITIONAL INFO.

8. Attach Mid Point B races (required if 4x4 Raker is longer than 11 feet and/or 6x6 Raker is longer than 17 feet).

9. Attach Horizontal Braces.

   - Connect Raker shores together near the top and bottom of the wall.
   - Connect Horizontal braces placed between the horizontal braces (between the upper and lower horizontal braces).

10. All raker shore systems must be connected with either X or V bracing placed between the horizontal braces, see page 3-6.

11. Attach the first brace to the rakers near the top and bottom of the wall.

12. Methods to Anchor the Sole Plate, in order to prevent the assembled shores from sliding away from the wall.

   - Preferred Method: Use Sole Anchor as shown on page 3-9 and as noted in ADDITIONAL INFORMATION on next page. This is preferred, since installation can be installed with less risk, at greater distance from wall.

   - Alternative Method: One may attach the sole plate directly to concrete, asphalt or soil by drilling a minimum of three 1" holes through the sole plate, concrete, asphalt or soil. See ADDITIONAL INFO. on next page.

   - Horizontal braces may be butt-spliced at center of any raker.

   - Horizontal braces placed between the horizontal braces may be built-up or center of any raker, see page 3-6.

   - Use 2x6 or 2-2x4 for each brace.

   - Use 3/4" x 12" or 4x4 lag screws with 4-6 each side splice. Lag screws must be countersunk with either X or V bracing placed between the horizontal braces, see page 3-6. (All raker shore systems must be connected with either X or V bracing placed between the horizontal braces.

   - Alternate Method: One may attach the sole plate to concrete, asphalt or soil by drilling a minimum of three 1" holes through the sole plate, concrete or asphalt, and as noted in ADDITIONAL INFORMATION on next page.

   - Preferred Method: Use Sole Anchor as shown on page 3-9 and as noted in ADDITIONAL INFORMATION on next page. This is preferred, since installation can be installed with less risk, at greater distance from wall.

   - Alternative Method: One may attach the sole plate directly to concrete, asphalt or soil by drilling a minimum of three 1" holes through the sole plate, concrete, asphalt or soil. See ADDITIONAL INFO. on next page.
ADDITIONAL INFORMATION – Solid Sole Raker

1. Design Load for one Raker:
   - 4x4 Raker = 4,000lb
   - 6x6 Raker = 5,600lb

2. Raker information:
   - 4 x 4 maximum length without mid-brace: 11 feet.
   - 6 x 6 maximum length without mid-brace: 17 feet.

3. To attach wall plate directly to a concrete/masonry wall use 1/2” drill-in anchors as noted below:
   - Place a minimum of two 1/2” x 8 ½” wedge anchors, or 1/2” x 8” long rebar or smooth bar (4” min embed in wall) through wall plate for 45 deg rakers. Use 3 anchors for 60 deg rakers.
   - At concrete walls, if 3/4” plywood backing is needed, attached it to wall plate with 16-16d nails, and use at least two 1/2”x 5 ½” wedge anchors, or 1/2” x 8” rebar/smooth bar through backing into concrete wall (4” min embed) each side of Raker.

4. To attach the wall plate directly to a wood framed wall.
   - Use 2 ft high x 3ft wide (min) x 3/4” or 5/8” ply backing nailed with 16-16d to the wall plate. Center raker on a stud, and use at least 8-16d nails through the backing material into studs and/or edge of floor, each side of Raker.

5. Place an 18” x 18” Foot under the sole at intersection of raker, when bearing on soil.
   - Use 3 – 2 x 6 x 18” or 2 – layers of 3/4” x 18” x 18” plywood.

6. A Sole Anchor can be secured to the ground or floor behind the sole plate to prevent sole plate from backing away from the wall.
   - Timber Anchors should be as least 4x4 size lumber, (6x6 is better). Place 6 – 1” diameter x 36” pickets per raker, spaced about 12” o.c. into Cohesive Soil, and as noted on page 3-9. Three pickets may be used into concrete or paving.
   - Specially made steel anchor brackets may be used with a minimum of 2- 1/2” x 5 ½” wedge anchors into concrete.
   - Concrete curbs, walls and other nearby secure structures may also be used.
**How to Construct a Split Sole Raker**

1. Determine where to erect the Raker Shores and the height of supported wall, and height of Insertion Point.
   - Temporary shoring may be needed, but most debris may not be.
2. Determine where to erect the Raker Shores and the height of the footing at.

**Material List (per raker)**

- Solid Sole Rakers should replace Solid Sole Rakers when debris are next to the damaged wall. Broad Sp. = 3

![Diagram of Split Sole Raker](image)
2. Select angle of Raker, then measure and cut the Wall Plate, Raker, and Bottom Brace to the proper length.
   - If there is rubble next to wall, wall plate will not extend to ground, and Bottom Brace will be attached at bottom of Wall Plate, and slope to within 6” of Trough Base.
   - Raker angle may be 45 or 60 deg into Trough Base.
   - Angle-cut both ends of Raker with 1½” return cuts for full contact with wall plate, top cleat, and Trough Cleat.
3. Pre-fabricate and cut, Raker, Wall Plate, Bottom Brace, and Sole Anchor to proper length, and perform raker angle cuts.
   - Layout Wall Plate, Raker and Bottom Brace at selected angle, and toe-nail Raker to Wall Plate.
   - Nail-on Top Cleat, then gusset to one side of this joint.
   - Nail one-Bottom Brace to Wall Plate, 6” from bottom, or in position to clear debris, but only tack-nail it to Raker.
   - Turn shore over and nail-on other gusset plus other Bottom Brace to Wall Plate.
   - Tack-nail Bottom Braces to Raker, so it can be moved to wall.
   - Assemble the Trough, as well as the 18” x 18” foot (if bearing on soil), and place in approximate position.
4. Move the partially prefabricated Split Sole Raker Shore in place at the wall and make sure it is plumb (side to side).
   - After securing the Sole Anchor, adjust the Trough, and drive wedges slightly against it.
   - Maintain full contact between the wall plate at the insertion point and at base of wall plate and the wall.
   - For bulging walls, add tight shims/spacers, then finish tightening wedges & finish nailing of Bottom Braces.
   - Anchor shore to concrete or masonry walls, by placing 2-1/2” drill-in anchors for 45 deg. & 3-1/2” anchors for 60 deg through the wall plate into wall, per ADDITIONAL INFO. 3. For wood walls, center raker on stud and see ADDITIONAL INFO. 4.
   - Place the Mid-Brace, if required by length of Raker, and erect the Horizontal and X-bracing, per Solid Sole.
   - Secure the Sole Anchor as shown on page 3-9, and as noted in ADDITIONAL INFORMATION 6 on next page.
ADDITIONAL INFORMATION – Split Sole Raker

1. Design Load for one Raker:
   - 4x4 Raker = 4,000lb
   - 6x6 Raker = 5,600lb

2. Raker: 4 x 4 max length w/o mid-brace: 11 feet
   - 6 x 6 max length w/o mid-brace: 17 feet

3. To attach wall plate directly to a concrete/masonry wall use 1/2” drill-in anchors as noted below:
   - Place a minimum of two 1/2” x 8 ½” wedge anchors or 1/2” x 18” plywood backing nailed w/ at least 8-16d nails, through backing into concrete wall (4” min embed) each side of raker.
   - Three pickets may be used into cohesive soil, as noted on page 3-9.

4. To attach the wall plate directly to a wood framed wall:
   - Use 2 ft high x 4 ft wide x 3/4” or 5/8” plywood backing nailed w/ at least 8-16d nails, through backing into studs and/or edge of floor.
   - Place a 18” x 18” Foot under Trough Base, when bearing on soil.

5. Use the Trough Base with a Sole Anchor:
   - To attach the sole plate to prevent the sole plate from backing away from the wall.
   - A Sole Anchor should be secured to the ground or floor backing.

6. For the sole plate to remain in the sole plate from backing away from the wall.
   - Place a 18” x 18” Foot under Trough Base, when bearing on cohesive soil.
   - Three pickets may be used into cohesive soil, as noted on page 3-9.

7. Use specifically made steel brackets with a minimum of two 1/2” drill-in anchors to concrete.
   - Concrete curbs, walls and other nearby secure structures may also be used.

8. Timber anchors should be at least 4x4 size lumber (6x6 is better), place 6 – 1” diameter x 36” pickets per raker, spaced 12” o.c. into cohesive soil.
   - Timber anchors should be at least 4x4 size lumber (6x6 is better), place 6 – 1” diameter x 36” pickets per raker, spaced 12” o.c. into cohesive soil.
   - Three pickets may be used into cohesive soil, as noted on page 3-9.

9. Special Nori made steel brackets may be used with a Trough Base.

10. Picket cribs may be used in cohesive or paving soil.

11. Place a minimum of two 1/2” drill-in anchors to concrete.

12. Place a minimum of two 1/2” drill-in anchors to concrete.
DOUBLE RAKER (May make from 4x4 or 6x6)

Is a Modified Solid Sole, full triangle, raker may be used to stabilize 2-story buildings & high walls. It has the same requirements and is built similar to Solid Sole, see pg 3-16

Material List: (per raker – need two or more)

<table>
<thead>
<tr>

<td></td>
</tr>
</tbody>
</table>

3-23
1. For 4x4 Dbl Rakers, with Insercion Pt. over 16ft, must add 2 sets of Mid-braces as shown.
2. For 4x6 Dbl Rakers, the added mid braces are only needed if Insercion Pt. is more than 24 feet.
3. Use standard Raker Splices (page 3-8) for Raker & Wall Pl.s.
4. Use 2-1/2" Wall Pl Anch. above Wall Pl Splice as shown.
5. Provide bracing between rakers (page 3-6). Place one set of cross bracing at each Mid-brace with Raker.
6. Horizontal 2x6 at Insercion of each Mid-brace with Raker.

### Double Raker Notes

- Raker using 4x4 is shown and noted in Material List for 4x6 Rakes see pg 3-2.
- For Cleats & Nailing: use 4x6 Wall Pl.
- Raker & Wall Pl. splice location

US&R SHORING OPERATIONS GUIDE

CONSTRUCTING LATERAL SHORING SYSTEMS

USER SHORING OPERATIONS GUIDE
US&R STRUCTURES SPECIALIST FOG
CONSTRUCTING LATERAL SHORING SYSTEMS

ALTERNATE- USING 3-2x4 STUDS for RAKERS
(Only if 4x4 lumber is NOT available)

- The following applies to Solid, Split-Sole, & Flying Rakers.
- If No.1 Douglas Fir is not available, construct rakers using Southern Pine, Hem-Fir and/or Spruce-Pine-Fir and reduce Design Load to 85%. If Eastern Softwoods, Western Cedar, or Western Woods are used, must reduce Design Load to 75%
- Raker may be made from two-3-2x4 pieces that are required length to have splice located above mid-brace intersection. Use Std plywood splice, per pg 3-9
- Wall Pl & Sole Pl are made from 3-2x4 staggered 2ft minimum thus:

```
<table>
<thead>
<tr>
<th>8'</th>
<th>K 2'</th>
<th>Typ. stagger</th>
</tr>
</thead>
</table>
```

- Nail 16d cooler/sinkers at 5" o.c. stagger thus: (.148 x 3.25")
This shore can be used to stabilize parallel, vertical walls, especially walls that are bulging.

This shore can be used to stabilize parallel, vertical walls.
HOW TO CONSTRUCT HORIZONTAL SHORE

1. Determine where to erect the horizontal shore.
   - After initial temporary shoring has been installed as needed, clear the area of debris.
   - A clearance of three to four feet wide is usually adequate.

2. Measure and cut the wall plates & struts to the proper length.
   - Measure between the wall plates where the struts are to be installed, deducting the width of the wedges.

3. Place both wall plates next to each other and attach 2 x 4 x 18" cleats and single 4x wedges to the wall plates w/ 5-16d each, just below where the struts will be installed.
   - If 4x wedge is not available, use 2x wedge on top of a 2x cleat, and nail with 5-16d.

4. Place the wall plates in the area that is to be shored, square and in line with each other and as plumb as possible by shimming any void spaces behind the wall plates.

5. Install the struts between the wall plates. Keep the struts in line and plumb with the wall plates.

6. Install a set of wedges horizontally between the Wall Plate and each Strut, then tap them together simultaneously until the struts are tight.
   - Toenail the wedges from top into wall plate. May need to use duplex nails for future adjustment.
   - Add 2 x 4 x 14" cleats on top of struts at wedge end, and secure with 3-16d to strut plus 2-16d toenails to Wall Plate.

7. At non-wedge end of strut, place half gusset one side.

8. If possible, attach the wall plates to the walls. (as for rakers)

9. Attach the diagonal braces to each side of the horizontal shore when not used for access or egress.
   - The diagonal braces should be long enough to span entire length and be attached to both wall plates and each strut.
   - When used, diagonal braces should be installed in a "X" pattern on opposite sides of struts. 5-16d each end.
ADDITIONAL INFORMATION – Horizontal Shore

1. Maximum shore width for 4 x 4 struts: 10 feet.
2. Maximum shore width for 6 x 6 struts: 16 feet.
3. Wall Plates: 4 x 4, 4 x 6, or 6 x 6.

- X-bracing is 2 x 6 with 5-16d each end.
- Spacing for 4 x 4 struts: Maximum 4 feet on center.
- Spacing for 4 x 6 struts: Maximum 6 feet on center.

Alternate: 2 x 6 x 18" Angle Cleat to confine wedges, 3-16d each end.
- Wedges are installed, 5-16d nails.
- Place one half of 4 x wedge set under end of strut where wedges are installed.
- Wedges: 2 x 6, 5-16d nails.
- Place 2 x 4, 14" long cleat under opposite end of strut from wall plate.
- Alternate 2: 2 x 4, 14" long cleat on top of strut with 3-16d to 16d each end.
- Alternate 1: 2 x 4, 14" cleat on top of strut with 2-16d, 5-16d nails.
- Place one half of 4 x wedge set under end of strut where wedges are installed.
- Wedges are installed, 5-16d nails.
- Place one half of 4 x wedge set under end of strut where wedges are installed.
- Wedges: 2 x 6, 5-16d nails.
- Place 2 x 4, 14" long cleat under opposite end of strut from wall plate.
- Alternate 2: 2 x 4, 14" Angle Cleat to confine wedges, 3-16d each end.
- Alternate 1: 2 x 4, 14" Angle Cleat to confine wedges, 3-16d each end.
- X-bracing is 2 x 6 with 5-16d each end.

Horizontal Shore – 2-Strut, Access Type

Alternate 1

- Wedges: 2 x 6, 5-16d nails. Add half gusset on side.
- Spacing for 2 x 4, 14" long cleat under opposite end of strut from wall plate.
- Alternate 2: 2 x 4, 14" long cleat on top of strut with 3-16d to 16d each end.
- Alternate 1: 2 x 4, 14" Angle Cleat to confine wedges, 3-16d each end.
- Wedges: 2 x 6, 5-16d nails. Add half gusset on side.
- Spacing for 2 x 4, 14" Angle Cleat to confine wedges, 3-16d each end.
- Alternate 2: 2 x 4, 14" Angle Cleat to confine wedges, 3-16d each end.
- Alternate 1: 2 x 4, 14" Angle Cleat to confine wedges, 3-16d each end.
- X-bracing is 2 x 6 with 5-16d each end.
- Spacing for 4 x 4 struts: Maximum 4 feet on center.
- Spacing for 4 x 6 struts: Maximum 6 feet on center.
- Wall Plates: 4 x 4, 4 x 6, or 6 x 6.
- Maximum shore width for 6 x 6 struts: 16 feet.
- Maximum shore width for 4 x 4 struts: 10 feet.
- Maximum shore width for 4 x 6 struts: 10 feet.

Additional Information – Horizontal Shore
WALL TIEBACKS

Tiebacks may be used to stabilize hazardous walls that are above the height that can be braced by Raker Shores. Tiebacks are constructed using the following:

- **Strong-backs** that extend from at least one floor to the one above or below. This allows the force placed in the strong-back by the tiebacks to be resisted by the floors of the structure.
- **Strong-backs** may be made from 4x4, 4x6, or double 2x8 or 2x10, depending on floor height. (depending on need)
- **Tiebacks** may be made from very strong rope or wire rope cable. (1/4” to 1/2” diameter wire rope cable)
- **Cable tiebacks** can be anchored to the tiebacks using a double basket or choker hitch. (Dbl basket is twice as strong as choker)
- **Loops** may be made in cable using Wire Rope Clips to facilitate the connections.
- **Cables** may be anchored to concrete structure using swivel hoist rings and drilled-in anchors.

WALL TIEBACK BRACING

4 STORY U.R.M. BUILDING

WINDOW SECTION
Note: Make sure that proper pins (by manufacturer) are installed and locked per manufacturer’s recommendations.

RAKER SHORE ALTERNATIVES

STANDARD "G" TILT-UP BRACE

- For use with single lift-up panels.
- Suggested for use on short caissons (less than 8 ft [2.4 m] in length).
- Weight: 155 lb (70 kg)

BIG "G" TILT-UP BRACE

- For use with double lift-up panels.
- Suggested for use on caissons from 8 ft to 16 ft (2.4 m to 4.8 m) in length.
- Weight: 245 lb (111 kg)

LITTLE "G" TILT-UP BRACE

- For use with single lift-up panels.
- Suggested for use on caissons from 16 ft to 24 ft (4.8 m to 7.2 m) in length.
- Weight: 100 lb (45 kg)

CONSTRUCTING LATERAL SHORING SYSTEMS

US&R SHORING OPERATIONS GUIDE
LATERAL WALL BRACING
RAKER & HORIZ. SHORES w/ PNEUMATIC STRUTS

Pneumatic Strut Manufacturers have developed special configurations that may be used to construct Raker and Horizontal Shores. See following pages for configurations.

- Individual Rakers can be configured from two struts plus a special wall plate rail, and special connections.
- Manufactured base plates can be connected into paving with 1” x 36” steel pickets driven through existing base plate holes.
- When system is constructed on soil, a special angle must be added to the base plate in order to bear on a standard Sole Anchor. (see page 3-9).
- A pair of Strut Rakers can be configured as a braced system, using wood X bracing that is connected to special clamp-on brackets that have wood nailers.
- When the Raker Strut is longer than 11 feet a mid-brace must be used, and the cross bracing must be a Double X. Note that the mid-brace must be a special strut that is able to resist both tension and compression.
- One manufacturer has developed a strut bracing system where the braces can resist both tension and compression forces.
- The Raker Rails must be connected to concrete/masonry walls using a minimum of two-1/2” x 5 ½” wedge anchors, or 1/2” x 8” rebar/smooth steel bars with 4” min. embedment in wall. (Two bars for 45 deg., and three bars for 60 deg. rakers).
- When supporting wood walls the Raker Rail must be carefully centered on a stud, and two 1/2” x 5” lag screws placed through the pre-drilled holes in the rail. 3/8” lead holes should be drilled at least 4” into the stud.
- Low pressure air (50psi max) may be used to extend the struts, but care must be taken to not impact the structure.
- Use hand tightening to snug-up all joints.
- See Section 7 for the tabled that give the Design Strength for Strut Raker Systems. Note that the connections that anchor the systems to wall and to ground may limit the strength. Consult a qualified Structures Specialist.
Photo of raker using strut bracing – no wood needed.

This method uses Wood X Bracing. The length of the raker strut is 11 feet or less.

STRUT RAKER
In this case the Raker Strut is longer than 11 feet, so a mid-brace must be used as well as Double X-bracing.
FULL TRIANGLE STRUT RAKER – ALL STRUTS

Note that the mid-brace, horizontal braces and diagonal braces must be special struts that can be adjusted for length, but remain rigid so that they can resist both tension and compression forces.

Photo of Raker Strut that is longer than 11 feet, and a short mid-brace is used as well as double X-bracing using Struts.
FLYING STRUT RAKER
This raker may be used as an initial, spot raker when there is a significant amount of debris at the base of the wall.
This shore would only be used if 4x4 wood struts were not available. As an alternative, if no wood was available, one could use the struts with a Raker Rail against each wall.

**Horizontal Shore Using Struts**

Use 2 or more struts as shown.

**Wall Plate**

Introduction

The strengthening and repair of structural members, components, joints and systems during disaster operations requires innovative design solutions, coordination with contractors and consideration of time and risk.

Following are examples and ideas that can be deployed during search and rescue operations to stabilize, repair or strengthen structural buildings and their components. These are no textbook solutions or systems that can be deployed in past disasters to stabilize, repair or strengthen structural buildings and their components during search and rescue, as they do not require thorough and engineering expertise. They are presented so that the user has a toolbox of alternatives to consider when faced with similar challenges.

Repair Techniques
Non-Contact Fiber Wraps

Repair, FAQ, and Glossary

US&R Structures Specialist FOG

Repair/Retrofit Method: Grout Filled Fiber Plastic Shell

Grout Filled FRP Shell: used as a high strength, grout filled form around damaged members. Used for: column confinement; column reinforcing; member stabilization; & component strengthening.

Manufacturers:
See Internet

Applications:
This grout filled, custom formed FRP Wrap can be applied to damaged steel, concrete or wood members, spalled concrete regions to maintain residual strength or increase strength.

Considerations/Limitations:
Competent Professional Engineer is required for use. Manufacturer input is essential for application and use.

FRP cylindrical shell can be fabricated, in-place, to any reasonable size. Wrap is available in 4 foot wide rolls. Grout filled FRP Wrap can be applied to any reasonable height. Cylindrical GRP is essential for application and use. Manufacturer input is required for use.

This guide lists custom formed FRP Wrap can be applied to

See Internet

Non-Contact Fiber Wraps

Repaired.

FAQ's and Glossary

User Structures Specialist FOG
Installation Sequence:
1. Trowel on 2-part epoxy.
2. Initially place FRP cylindrical shell.
3. Adjust the shell so the 2 layers are in contact.
4. Place ratchet straps to temporarily hold the shell’s shape.
5. Mix and pour the non-shrink grout, and use small vibrator or rod to consolidate.
Pre-placed aggregate is inserted with low-viscosity in order to avoid having the curing reaction generate too much heat. It is very important to use the proper low-viscosity epoxy in order to prevent the epoxy from curing, and then epoxy injected into the port at the current level of the epoxy. The epoxy should be injected starting at the lowest point of the formed repair, and ports should be placed every 4” (100 mm) above the epoxy to allow the epoxy to flow into the voids.

The aggregate must be clean and have uniform size in order to allow the epoxy to flow. Plywood has also been used as a form. Plywood has also been used as a custom fit form. Proper covered metal lath has been used as a custom fit form. Competent Professional Engineer is required for use.

Considerations/Limitations:

- Sustain using Virginia shale or jackets.
- See Internet.

Note: Pre-placed aggregate is inserted with low-viscosity in order to avoid having the curing reaction generate too much heat.
Repair of Badly Damaged Column in Puerto Rico

Before

After

- Carefully pour clean, small aggregate in form to fill all voids.
- Inject low viscosity epoxy into aggregate, starting from bottom. (It takes 24 hrs to develop reasonable strength - at 20°C)

Existing Beam

Plaster covered, metal lath form to contain aggregate

Existing Beam, badly distorted and surrounded by fragmented concrete

Concrete Column

Metal wire to tie form at bottom
STEEL JACKET COLUMN REPAIR

Repair/Retrofit Method:
Concrete filled Steel Jacket

Jacket a damaged column with full height steel shell and fill with structural concrete for stability and/or strengthening.

Manufacturers:
See IST Struct. Spec for local contractor & fabrication shop.

Applications:
Primarily used for damaged columns. Applicable to any type of column (concrete, steel, etc.).

Considerations/Limitations:
Competent Professional Engineer is required for use.
Steel encasement is prefabricated in two half rounds and bolted together. Bolting is preferred since less time is spent in danger area during erection.
Steel encasement is 3/16" to 1/4" (4.8 to 6 mm) thick.
Encasement should clear damaged column by at least 3" (80 mm).

Photo shows a set of half-round steel encasements just prior to erection. Note that the steel encasement is stacked two high in this installation.
STEEL JACKET JOINT REPAIR

Repair/Retrofit Method: Grout Filled Steel Jacket

Jacket column joint with steel shell and fill with fast setting, high strength, non-shrink grout for stability and/or strengthening.

Manufacturers:
See IST Struct. Spec for local contractor & fabrication shop

Applications
Primarily used for damaged column joints. Applicable to any type of column. Shown below for large concrete column joint retrofit.

Steel encasement was prefabricated from four steel angles and four steel plates. It was prefabricated as two halves, then erected and welded at the two unconnected corners.

Considerations/Limitations
Competent Professional Engineer is required for use.

The space between the column and jacket should be kept small in order to minimize the thickness of the grout.

For ease of fabrication the column should be made using steel angles (l3 x 3 x 5/16" minimum).

The steel used for a square jacket needs to be in the range of 3/8" minimum thickness.

The steel jacket may be heavy, with each side weighing 100 lbs or more. Therefore some sort of equipment may be required to lift it into place.

Temporary forms will usually be needed that are placed on sound concrete below the jacket, in order to support it and keep the grout in place until it hardens.

High strength, cementitious, non-shrink grout should be used. It is available in bags, can be mixed in the field, and can attain high strength in 12 to 24 hours (depending on outside temperature).

The steel jacket may be heavy, with each side weighing 100 lbs or more. Therefore some sort of equipment may be required to lift it into place.

Repaired/Replaced Method: Grout filled Steel jacket
This steel jacket was used to provide strengthening at several column joints at the bomb damaged Murrah Federal Office Building in Oklahoma City.

It was placed where the concrete floor beam had been blown away from the concrete column, leaving a badly cracked, and unbraced joint.
COLUMN STABILITY REPAIR

Repair/Retrofit Method:

Column Length Bracing

Supporting columns and reducing the column length with bracing members attached to the column in critical buckling directions. Additional bracing members are commonly used for damaged columns. See IST Struct. Spec. for local contractor & fabrication shop.

Application:

Mostly used for damaged columns that have become unsupported at floor levels. Applicable to any type of column.

Considerations/limitations:

- A Competent Professional Engineer is required for use.
- Braces need to be positively connected at each end and the tension forces.
- Braces need to be of sufficient size to resist both compression and possible tension forces.
- Bracing should be provided in the north-south as well as east-west direction at each floor where the floors have been dislodged. If possible, bracing should be provided in the north-south as well as east-west direction at each floor where the floors have been dislodged.
- Braces need to be positively connected at each end and the anchoring structure must be adequately strong and rigid.
- The minimum design force for the braces should be at least 2 percent of the total force in the damaged column. If the column is misaligned, the design force should be 5 percent minimum.
This cross-section at the Murrah Federal Office Building in Oklahoma City shows how a truss work of pipes was used to laterally brace Columns F22 and F20. The floors on all sides of these columns had collapsed up to the 4th Fl, and they were in danger of collapsing as the debris was being removed to access the buried victims.

This schematic, partial cross-section of the World Trade Center Basement following the 1993 Truck Bombing shows the configuration of steel tube bracing that was used to brace the steel basement columns after the basement parking garage concrete floor slabs had collapsed, leaving the steel columns standing 70 ft tall without lateral support.
SPRAY APPLIED CONCRETE REPAIR

**Repair/Retrofit Method:** Shotcrete/Gunite, Cementitious Spray-on Concrete/Mortar.

Spray on concrete type material that can stabilize or strengthen members, components and systems.

**Manufacturers:** Local Contractors, especially those with swimming pool experience.

**Applications:** Damaged concrete regions are stabilized or strengthened with sprayed-on concrete type material (Gunite/Shotcrete). The affected area is encased with a concrete outer shell. Reinforcing steel or mesh may be placed first, in order to provide greater strength. Moreover, a structural cooling wrap is essential to ensure the shotcrete is developed.

**Considerations/Limitations:**
- The shotcrete requires at least 5 days to develop half of its strength, and 21 days to develop about 90% strength.
- The shotcrete should be cured by applying a moisture preserving sealcoat and/or keeping the surface damp.
- A competent professional engineer is required for use.
- Application contractor’s input is essential to determine limitations.

See next page for use of shotcrete in New Zealand, March 2011.

**Summary:**
- Spray on concrete type material that can stabilize or strengthen damaged concrete regions are stabilized or strengthened with sprayed-on concrete type material (Gunite/Shotcrete). The affected area is encased with a concrete outer shell. Reinforcing steel or mesh may be placed first, in order to provide greater strength. Moreover, a structural cooling wrap is essential to ensure the shotcrete is developed.

**Limitations:**
- Local Contractors, especially those with swimming pool experience.

Steel Straps Used to Confine Concrete

Repair/Retrofit Method:
Steel Strapping Tape

Confinement of damaged concrete members using Heavy Duty Strapping is available in 1/2", 5/8", and 3/4" wide rolls (10 to 20 cm) in varying gauges.

To better confine the concrete, Strapping may be applied around wood and/or plywood spacers.

Considerations/Limitations

- Easy to use and apply. Available locally.
- Confinement of damaged concrete members can be improved by applying many layers/widths of steel strapping.
- Damaged areas with many layers/widths of steel strapping are confined by binding the damaged concrete members together.

Application:
Globalindustrial.com, Uline.com, & others, see Internet.

Manufacturers/Distributors:
- Steel Strapping
- Repair/Retard Method: Steel Strapping Tape
Column F-22 at the Murrah Federal Office Building in Oklahoma City, where the Third Floor used to be. Steel strapping was used as a temporary measure prior to installing a grout filled steel jacket.
**Protected Entry**

Repair/Retrofit Method: Use rigid pipe/casing for access.

**Considerations/Limitations:**
- Steel or ductile iron pipes as well as steel casings should be 1/2" (13 mm) thick.
- Concrete pipes should be available in 10ft (3m) lengths and longer.
- Steel, ductile iron pipes, or steel casings should be a minimum of 3ft (1m) in diameter.
- Concrete pipes should be available in 20ft (6m) lengths or longer. Those can be pushed together to form longer lengths.
- Steel or ductile iron pipes as well as steel casings should be easy to use and be available locally.
- Loaders or excavators may need to enter the pipe to remove collected debris, in order to get it into place.
- Hazards originating from the exterior walls, pipes may be pushed into a damaged building to provide protection from falling debris. Ductile iron or concrete pipes or steel pipe casings can be used.

**Hazards:**
- Use rigid pipe or pipe casing to provide access protected from falling.
PROTECTIVE BARRIERS

**Repair/Retrofit Method:** Use Rigid Containers & Boxes as Barriers.
Use shipping containers and/or rigid boxes as protective barriers.

**Manufacturers/Distributers:**
Shipping companies, Concrete vault suppliers, and waste disposal companies.
Azteccontainer.com; Steelshippingcontainer.com; Onsitestorage.com. See Internet

**Applications**
Use shipping containers, dumpsters, and/or concrete vaults as barriers adjacent to hazardous buildings and vulnerable rock faces.

**Considerations/Limitations**
Easy to use, and available locally.
Shipping containers are available in 20, 40, 45 and 48 foot lengths.
Steel debris boxes (dumpsters) may also be used, and are available in 3, 5, 8, 15, 18, 20, 30, and 40 cubic yard sizes.
These rigid containers can be ballasted with heavy objects, such as water bladders, sand bags, and steel scrap, in order to add sliding and overturning resistance.
Containers may be stacked up to 3-high, but should be connected together using chains or high strength straps.
Containers may be placed 2-wide to improve resistance.
FREQUENTLY ASKED QUESTIONS

Question H-1: What to do if need 4x6 header and only have 4x4 and 2x4 material?

Ans.H-1a: Nail 2x4 to top of 4x4 with 16d@3" o.c. This build-up is about 80% as strong as 4x6

Ans.H-1b: Stack 2-4x4 and toenail together. This build-up is slightly stronger than most any wood header. The concrete will span stronger than most any wood header. The concrete will span slightly faster than 4x4@6". Since the concrete is stiffer and 4x4@6" is a cg header with 4x4@6". It is a 6x6 header with 6x6@6". To support a minimally cracked concrete beam or slab, with

Ans.H-2: To support a damaged concrete structure, header size depends on the condition of the concrete structure.

Ans.H-3a: To support a damaged wood structure, use a 4x4 header.

Ans.H-3b: To support a damaged wood structure, use a 6x6 header.

Question H-2: What to do if need 4x8 header and only have 4x4 and 2x4 material?

Ans.H-2: Stack 2-4x4 and place ½" or ¾" plywood each side. Nail 8d@3" o.c. each side to each 4x4. (stop ply short of posts)

Question H-3: How big of a header is needed?

Ans.H-3a: To support a damaged wood structure, use a 4x4 header.

Ans.H-3b: To support a damaged wood structure, use a 6x6 header.

Question H-2: What to do if need 4x4 header and only have 4x4

Ans.H-2: Stack 2-4x4 and toenail together. This build-up is slightly stronger than 4x4@6". About 80% as strong as 4x4

Ans.H-1a: Nail 2x4@6" with 6x6@6". This build-up is stronger than 4x4@6"

Ans.H-1b: Stack 2x4@6" and toenail together. This build-up is slightly stronger than 4x4@6"

Question H-1: What to do if need 4x6 header and only have 4x4
POSTS

Question P-1 If only 2x4, 2x6, 2x8 and 4x4 are available, how to create a 6x6 or 8x8 post?

Ans. P-1a To construct a 6x6 one may use the following:
Build-up 4-2x6 to form a 5½” x 6” net post. Inter-nail with 16d@5” o.c. staggered plus add ½” carriage bolt 6” from each end and 3ft o.c. As alternate to the bolts add 6”x ¾” x 12” plywood gussets on 6” faces at same spacing. As a less desirable option, add 2x6 to side of 4x4, plus 2x4 +½” plywood fill to adjacent side. Inter-nail with 16d@8” o.c.

Ans. P-1b To construct an 8x8 one may use the following:
Build-up 5-2x8 and inter-nail with 16d@5” o.c., plus add ½” carriage bolt 6” from each end and 3ft o.c. As alternate to the bolts add 6”x ¾” x 12” plywood gussets on 8” faces at same spacing or
Build-up 4-4x4 to from a 7”x7” net post. Place 8ft” long x ¾” plywood gussets on all 4 sides at mid-height, plus 16” long x ¾” ply, all 4 sides near each end. Nail each gusset to each 4x4 with 8d @ 3”o.c. stagger.

Question P-2 What to do if post spacing is not exactly as shown in FOG?

Ans. P-2 Most types of shores that we build have posts spaced at between 30” and 4ft o.c. and headers should be sized accordingly (as indicated in Ans. H1 through H3). The total capacity of the posts should always be more than the total load. Remember that the capacity of a 4x4x8ft high post is 8000lb and a 6x6x12ft high post is 20,000lb.

• If the post spacing is more than 5ft o.c. the header size should be increased, or the capacity should be decreased. Decrease capacity 10% for a 6” increase in post spacing, and 25% for a 1ft increase in spacing.
LACED POSTS

Question LP-1 What is the correct configuration of the diagonals, and does it really matter?

Ans. LP-1: The 4 to 1 max is based on the out to out dimension.

Q: oc: up to 17 ft high?

Post is 4 to 1. Why can you build a system with 4x4 post at all?

Many Laced Post Systems have also been tested. Since 2013 shores built using both Hem-Fir and weaker grades of Douglas Fir have also been tested. Warning of system failure: Lenses of diagonal pairs were warped, giving ample time for the design load. Also significant cupping of wedges was observed below the design load. Typically, failures occurred at between 2.5 and 3.5 times.

Question LP-2 If the Maximum Height to Width Ratio of Laced Post is 4 to 1, why can you build a system with 4x4 post at all?

Ans. LP-2: The 4 to 1 max is based on the out to out dimension, and for posts 4 ft o.c., the 4 x 4 out to out is 17.2. USE 17 FEET

USE 17 FEET
CRIBBING

Question CB-1  Maximum height to width ratio is specified as 3 to 1 in the Shoring Training (SCT, Mod 2) and 2 to 1 in Lifting and Moving Training (SCT Mod4), which is correct?

Ans.CB-1 Actually, both are correct. For normal shoring where Cribbing is constructed to support a damaged structure the 3 to 1 ratio may be used, assuming that the Crib is being loaded, more or less, uniformly.

- When Cribbing is being used in a "Lift a little and Crib a little" application the 2 to 1 ratio is more appropriate due to the more dynamic nature of the potential loading.

- For both cases the height of cribbing should be minimized, since differences in the hardness of adjacent pieces of wood can cause differential deflection that can lead to instability. Therefore it is recommended that cribs using 4x4 lumber be limited to 4ft in height (6x6 limit to 6ft in height). If greater height in needed, these effects can be minimized by using a 3 member x 3 member layout.

WINDOW SHORES

Question W-1  Why do we need to provide wedges in both Horizontal and Vertical directions for these shores?

Ans.W-1  The need for the wedges in the Vertical direction is easily understood. The wedges that bear on the Sides of the openings at top and bottom are very important is situations where the Openings will tend to Rack or Bulge, such as Earthquakes, and the Window Shore should be strongly "X" braced in this case.
NAILS

A-2 4-24

Question N-1  What embedment is required to develop the full value of a nail?

Ans.N-1  In general, nails should be embedded a little more than half their length in the piece into which they are anchored.

Question N-2  What should we do when nailing a 2x to a 2x, since the embedment is only 1.5"?

Ans.N-2  The strength of these nails is 77% since the embedment ratio is 1.5/1.94. Since most 2x to 2x nailing involves lateral bracing, connections this is close enough.

Question N-3  Can we use 16d Cooler Nails (.148"x3.25") instead of 16d common (.162".x3.5")?

Ans.N-3  Yes, since it is very important to minimize the splitting of wood in nailed joints, and 16d vinyl coated nails cause much less splitting than those using common nails. These cooler nails may be used in FEMA shoring and drive easier. This isn’t a FEMA requirement that has been tested as it is a new product. These cooler nails have been used in Rakers as well as Laced Posts, and have proven reliable during Structures Specialist Training. There was no significant difference in test results, when using cooler nails and the nails being mocked. 8d & 16d cooler nails have been used in Rakers as well as Laced Posts that have been tested during Structures Specialist Training.
NAILS (continued)

Question N-4  What nailing should be used if No. 1 Douglas Fir or Southern Pine lumber is unavailable? (Design Load for Nails is shown on page 7-12)

Ans.N-4  As previously discussed, the nail strength value is approximately based on the density of wood, therefore reduce all nail values for the following:

- For Hem-Fir and Spruce-Pine-Fir use 85% of full strength.
- For Eastern Softwoods, Western Cedar & Western Woods use 75% of full strength.

This means that one should, accordingly, reduce the capacity of shoring, built using these species. However, for Raker Shores, since the strength is effectively based on the Cleat nailing or the Picket/Soil strength, one may add 3-nails to the 17-nail pattern when using species with either 85% or 75% strength reduction species listed above.

Question N-5  What nailing should be used to connect rough cut 2x lumber, that is a full 2” thick?

Ans.N-5  In order to obtain adequate embedment, one should use 20d box nails instead of 16d. The 20 box nail has about 90% the strength of 16d common and same as the 16d cooler.
Question R-1 What is the most appropriate spacing for Raker Shores?
Ans. R-1
The spacing should be based on the height, weight, and condition of the wall being supported. Each Solid Sole or Split Sole Raker is designed to support a 4000 lbs horizontal force if built using No. 1 Doug Fir. Design Load is reduced to 85% &75% for other species, see page 4-29. The Raker Base is a structural fastener, and in any case the Raker Base should be asked to evaluate the situation, and specify the required spacing as well. A Structures Specialist should be consulted to ensure the need for extra anchorage.

Question R-2 How far should a Raker be spaced from the corner?
Ans. R-2a
This depends on the condition of the Raker. It would be appropriate to place the first Raker as near the corner as possible. In cases where the corner is badly cracked, it would be advisable to place the first Raker in the middle of the corner.
Ans. R-2b
When wall corners appear to be in good condition, the first Raker may be spaced from 4 ft to 8 ft from the corner.

Question R-3 What is the best configuration of the Flying (or Friction) Raker?
Ans. R-3
The Flying Raker is intended to be an initial/spot shore, and is the weakest type of Raker. It is useful when debris are found at the base of the damaged wall. Since the bottom brace is designed as a horizontal brace, it is usually used to brace the wall and is the weakest type of Raker. A Structures Specialist should be consulted to evaluate the situation, and specify the required spacing for Raker Shores.

RAKER SHORES (continued)

Question R-4  When should one use a 30 degree Raker?

Ans. R-4  The 30 degree Raker is the most efficient Raker, since the flatter angle allows the horizontal resistance to be 86% of the Raker Force, and the Vertical lift is only 50% of the Raker Force. However, access, and height of insertion point may not allow the 30 degree configuration to be easily constructed.

• Also it takes a longer Raker to reach the same insertion point as for 45 & 60 degree Rakers.
• 30 degree Rakers should be used when bracing the One-Sided Trench (if possible).

Question R-5  How should one connect the upper end of a 60 degree Raker, since we no longer recommend that the wall plate has been notched out 1 inch?

ANS. R-5  The 1” notch is no longer recommended for 60 degree Rakers. Use a 2x4x30” cleat with 20-16d nails for a 4x4 Raker System, and a 2x6x30” cleat with 29-16d nails for 6x6 Raker.
**US&R STRUCTURES SPECIALIST**

**FOG**

**REPAIRS, FAQ, and GLOSSARY**

**4-28**

**DIAGONAL BRACING**

**Question DB-1**

Under what conditions does one need to use Diagonals in a "X" configuration, and when is a single Diagonal acceptable (as in Laced Posts)?

**Ans. DB-1**

Based on the Maximum Length to Width Ratio of 50 (L/D=50 max), if a Diagonal Brace is more than 11 feet long, one must use an "X" since it cannot be assumed that the Diagonal is 7 1/2" or less in length, the Diagonal may be used.  

**Question DB-2**

Is it necessary to nail one X-brace to the other at the crossing?

**Ans. DB-2**

Technically, no nailing is required, but it is a good idea.  

Based on this information, it should be understood that the maximum spacing for Laced Posts is 4 ft for 4x4 & 5 ft for 6x6.
Question L-1  What adjustments are needed if No. 1 Douglas Fir is not available? (Applies to Vertical and Laced Post Shores, Cribbing, Sloped Floor and Raker Shores)

Ans. L-1  Design Loads and nail strength values, in general, are based on the density of the wood species. The following reduction in values should be used:
- For Southern Pine, Hem-Fir and Spruce-Pine-Fir, reduce Design Load to 85% (of the values given for Doug Fir No.1)
- For Eastern Softwoods, Western Cedar & Western Woods, reduce Design Load to 75%

This means that the Design Load should be proportionally reduced or the post spacing should be proportionally reduced.

Example 1: 85% of 4 ft post spacing, would be 3' - 6", and 75% of 4 ft would be 3 ft.

Example 2: For Laced Post, 85% of 32k = 27k, & 75% = 24k
For Raker Shores, 85% of 4k = 3.4k, & 75% = 3k

Question L-2  What is strength reduction if pressure treated lumber is used? (may be called CCA, Wolmanized, NatureWood, Natural Select)

Ans. L-2a  Most all commercially treated sawn lumber that has been treated with a "Preservative" to reduce its susceptibility to insects and decay, has been embedded with some sort of Copper-based preservative or with Creosote. Chromated Copper Arsenate (CCA) has been the most common for sawn lumber, but due to environmental concerns, other preservatives are being introduced.

Ans. L-2b  No "Significant" reduction in wood strength occurs due to treatment using Copper based or other preservative compounds. However, most pressure treated sawn lumber will be sold in a "Dry" condition which makes it more susceptible to splitting caused by nailing. Also some treated wood may be split and or warped.

One should use a "Common Sense" approach and avoid badly split or warped wood, especially for critical parts of shoring like Raker Cleats and the Diagonals in Laced Post Systems.
MISCELLANEOUS QUESTIONS

Question M-1
Should we shore Steel Bar Joist from the bottom (Bottom Chord), or do we need to place the shoring system up under the top (Top Chord)?

ANS. M-1
One should not place a shoring system directly under the top chord, in any case. In the event that the system is needed under the top chord, it is recommended to place shores directly under the intersection of the web members in more than one location for the same group of trusses. This is spread out the load as much as possible. If some perpendicular to the truss, bracing is present, place the shores as near that location as practical, keeping the shores as near that location as practical.

Question M-2
Should we secure the sole of a sloped floor?

ANS. M-2
Absolutely, yes one should secure the sole. Most sloped floors would be somewhat unpredictable, and securing the sole could be very beneficial.

Question M-3
Should we place the wedges at the top or at the bottom of a Prefabricated Door or Window Shore, when there is the possibility that the bottom will become submerged?

ANS. M-3
There is no structural problem in placing the wedges at the top of a Prefabricated Door or Window Shore. However, there may be cases when you cannot reach the bottom of the shore from the top. One should not place a shoring system directly under the bottom chord, or do we need to place the shores directly under the bottom chord (Bottom Chord) of the system and the shores would be more effective if they were placed from the bottom (Bottom Chord) or the top (Top Chord).
PREFERRED SHORE CONSTRUCTION SEQUENCE

Shoring during long-term incidents should be constructed with as much prefabrication as practical, and in a sequence that provides an increasingly safer rescue environment.

However, there will be many incidents that have a relatively short duration, and may only require spot shores and/or 2 and 3 post vertical shores. In these and other cases it also may not be practical to prefabricate the shoring.

The "Preferred Sequence" that is suggested here, should be followed, only if it is practical, as in a damaged concrete structure that requires a prolonged shoring operation.

- Vertical Shoring should begin with the installation of spot shores, such as a Tee Shore, Double Tee Shore, Pneumatic Struts or a single post.
  - These may be called Class 1 Shores (one dimensional).
  - Class 1 shores are intended to quickly reduce risk, for a short period of time.
  - The Double Tee is actually more like a Class 2 Shore.

- If the Rescue Scenario is prolonged, then one should further reduce risk by installing 2-Post Vertical Shores (or single Sloped Floor Shores).
  - The 2-Post Vertical is just half of a Laced Post, and can be partly prefabricated, and quickly carried into place.
  - These may be Class 2 Shores (two dimensional).
  - Vertical Shores with 3 or more posts are difficult to prefabricate and to develop into a full 3-Dimensional Systems. However they may be very useful in providing continuous support under damaged beams or a series of broken wood, floor joist.
The next step in the Shoring Sequence would be to convert the 2-Post Shores into Laced Post Shores (or complete the Sloped Floor Shores as Braced Pairs).

These are well braced 3-Dimensional Systems, and may be called Class 3 Shores. The base members could also be restrained from sliding between them.

If more positive lateral bracing is desired, the base members may be interconnected using plywood strips as shown on page 2-45.

All Shores should be installed using a similar progression.

First one Raker would be built and moved into place.

Raker Shores should be installed using a similar progression. Similar to Rake Sole Anchors.

The base members could also be restrained from sliding on the concrete slab by using anchor bolts or assemblies.

If more positive lateral bracing is desired, the base members may be interconnected using plywood strips as shown on page 2-45. Only friction for lateral bracing.

Cribbing is a 3-dimensional system, but most crib rely on.

Only friction for lateral bracing.

Class 3 Shores are the most stable systems that we can build in this sequence.

Floor Shores as Braced Pairs.

The next step in the Shoring Sequence would be to convert the...
GLOSSARY OF TERMS

Arch- A curved structure used as a support over an open space. It produces an outward thrust as well as downward forces at its supported ends.

Axial load- A tension or compression load which passes through the center of a structural member (like a column, beam, truss member, diagonal brace or hanger rod).

Bay- The space between beams/trusses or between rows of columns considered in transverse planes.

Beam- A horizontal structural member, subject to compression, tension, and shear, usually found in any one of three different configurations: cantilever, continuous, and simple.

Bearing Wall- An interior or exterior wall that supports a load in addition to its own weight.

Brick Veneer- A single thickness of brick wall facing placed over frame construction or structural masonry.

Buttress- A wall reinforcement or brace built on the outside of a structure, sometimes called a "wall column." When separated from the wall and connected by an arch at the top, it is called a flying buttress.

Cantilever Beam- A beam that has two or more supports but extends beyond one end support and ends in clear space (similar to a diving board).

Cavity Wall- A wall of two parallels wythes (vertical wall of bricks, one masonry unit thick) separated by an air space. Wythes are connected by metal ties.

Chair- A device of bent wire used to hold reinforcing bars in position.
CHECK

A lengthwise separation of wood fibers, usually extending across the annular rings. Check commonly results from stresses that develop in wood during the seasoning process.

CHOKER HITCH

A sling where one end passes through the eye of the opposite end (or through the inside of the opposite loop of an endless sling).

CHORD

Main members of trusses distinguished from diagonals (like a truss). Check elsewhere to the adjacent members.

CHORD HITCH

A sling where one end passes through the eye of the opposite end (or through the inside of the opposite loop of an endless sling).
Collapse – continued

**Soft 1st Story Collapse** – Occurs when only the first story of a building collapses (usually due to earthquake) due to the weakness and/or reduced stiffness of the 1st story when compared to the remainder of the building.

**Column** - Vertical structural member subject to compressive forces.

**Compression** - Force that tends to push the mass of a material together.

**Concentrated Load** - A load applied at one point or within a limited area of a structure.

**Concrete** –
- **Definition** - A material used in construction that is extremely versatile and relatively noncombustible. Extremely effective in compression, but weak in tension and requires the use of reinforcing steel, either rebar or high strength cable.
- **Post-tension** - Tension is applied to the reinforcing steel cable after the concrete is hardened and anchored only at the ends of the structure.
- **Poured in place** - Concrete that is poured into the location where it is going to exist.
- **Precast** - Concrete that is cast, allowed to harden, and then erected as part of a structure.
- **Pretension** - Tension is applied to the reinforcing steel cable in a factory, prior to pouring the concrete. The concrete is then poured and bonds to the reinforcing.

**Confined Space** - Any space that lacks ventilation; usually the space is larger in area than the point of entry.

**Continuous Beam** - Beam supported at both ends and at one or more interior supports.

**Cornice** - A horizontal projection which crowns or finishes the eaves of a building.

**Cribbing** - Short pieces of lumber used to support an object.

**Curtain Wall** - An exterior wall supported by the structural frame of the building. Also called an infill wall. Usually has no structural value, but may carry some load after a collapse.
Dead Load - One of the five major loads that must be considered in the design of a building (live, wind, impact, and seismic loads are the others). A Dead Load is a static or fixed load created by the structure itself and all permanent elements within.

Deck - A horizontal surface supported by floor or roof beams.

Furring - Wood strips fastened to a wall, floor, or ceiling for the purpose of attaching covering material.

Footing - The part of a building which rests on the bearing soil and transfers that load to the foundation wall. Also the base for a column.

Footing - The part of a building which rests on the bearing soil and transfers that load to the foundation wall. Also the base for a column.

Flashings - Sheet metal used in roof and wall construction to keep water out.

Facade - The front or face of a building.

Fascia - A flat vertical board located at the outer face of a cornice.

Furring - Wood strips fastened to a wall, floor, or ceiling for the purpose of attaching covering material.

Furring - Wood strips fastened to a wall, floor, or ceiling for the purpose of attaching covering material.
Gusset Plate- A metal fastener in the form of a flat plate used to connect structural members. (also the plywood gusset plate connections used for US&R shoring)

Header Beam- A support used to reinforce an opening in the floor of a wood frame, ordinary, or heavy timber building.

Hollow Wall- A wall of two parallel wythes which are separated by an air space between them, but lack ties to hold the wythes together.

Hydraulic Shoring- Trench shores or jacks with movable parts that are operated by the action of hydraulic fluid.

Impact Load- A sudden load applied to a structure suddenly, such as a shock wave or a vibrating load.

Joist- A piece of lumber used as a floor or roof beam.

Kiln-Dried Lumber- Lumber that is dried in an oven-like structure.

Kip- One thousand pounds.

Knot- A hard, irregular lump formed at the point where a branch grew out of a tree.

Nonbearing Wall- A wall that supports only its own weight.

Open Web Joist- A lightweight steel truss used as a floor or roof beam. It is made from a steel bar, bent at 90 degree angles, and welded between angle irons at the top and bottom bar bends.

Operating Radius- The horizontal distance from the centerline of rotation (the center pin of the cab) to a vertical line through the center of the sheave at the end of the boom.

Parapet Wall- A portion of an exterior, fire, or party wall that extends above the roof line.

Partition- An interior wall, not more than one story in height, that separates two areas in the same building but is not intended to serve as a fire barrier (similar to curtain wall).

Party Wall- A wall that lies on a common lot line for two buildings and is common to both buildings. Most of these walls may be constructed in a wide range of materials or assemblies.

Pier- A supporting section of wall between two openings. Also a short masonry column. Also a deep concrete foundation.
Pilaster - A masonry or concrete column bonded to and built as an integral part of the inside of a masonry wall.

Plate - The top or bottom horizontal structural member of a wood frame wall or partition.

Platform Construction - Most common method of wood frame residential building construction (older structures may be balloon framed). A wood wall for this type of construction has a single 2x sole at bottom and a double 2x plate at the top, with 2x studs sitting on the sole and having the double plates on top. Floor joists bear on the top plates and they are sheathed with plywood or solid 1x sheathing.

Pneumatic Shoring - Trench shores or jacks with movable parts that are operated by the action of a compressed gas.

Purlin - A horizontal member between trusses or large beams which supports the roof. These are usually 4x6 members.

Secondary Collapse - A collapse which follows the initial collapse. Secondary Collapse can be caused by application of additional loads (aftershocks, wind, etc.) or by rescue equipment or rescuers. Secondary Collapse is usually caused by heavy structure and objects that remain elevated and may move downward under the force of gravity.

Scab - A short piece of lumber generally cut from 2" x 4" stock, that is nailed to an upright to prevent the shifting of a shoring jack. A scarf - A short piece of lumber generally cut from 2" x 4" stock, that is nailed to an upright to prevent the shifting of a shoring jack.

Sandwich Wall - A nonbearing wall whose outer faces enclose an insulating core material. Some may be used as bearing walls.

Rafter - A 2x or 3x member, usually spaced at 16" or 24" on center, which supports a sloped roof. These are usually 4x6 members.

Restrained Beam - A beam whose ends are so securely welded or bolted so that they cannot rotate. A restrained beam supports a sloped roof and may have a simple span.

Ridgepole - A horizontal timber that frames the highest point of a peak roof. Roof rafters fastened to the ridgepole.

Secondary collapse - A collapse which follows the initial collapse. Secondary collapse can be caused by application of additional loads (aftershocks, wind, etc.) or by rescue equipment or rescuers. Secondary collapse is usually caused by heavy structure and objects that remain elevated and may move downward under the force of gravity.

Screw Jack - A trench jack with threaded parts. The screwing allows the jack to be lengthened or shortened.

Scob - A short piece of lumber generally cut from 2" x 4" stock, that is nailed to an upright to prevent the shifting of a shoring jack.
Sheathing- The covering applied to the floor/roof or wall framing of a building to which siding is applied.

Sheeting- Generally speaking, wood planks and wood panels that support trench walls when held in place by shoring.

Shoring- The general term used for lengths of timber, screw jacks, hydraulic and pneumatic jacks and other devices that can be used to hold sheeting against trench walls. Individual supports are called shores, cross-braces, or struts.

Simply Supported Beam- A beam supported at both ends.

Slope of Grain- In lumber, the angle formed between the direction of wood fibers and the long axis of the member; usually expressed as a ratio of rise-to-run, for example, 1:12.

Snatch Block- A wood or steel shell single pulley block that can be opened on one side to accept a rope or cable.

Spalling- The expansion of excess moisture trapped within the cement of the concrete which results in tensile forces within the concrete, causing it to break apart. Common occurrence when the concrete is exposed to fire.

Spandrel- That part of a wall between the head of a window and the sill of the window above.

Static Load- A load that remains constant.

Stress –

**Definition**- A force per unit area exerted upon a structural member that strains or deforms its shape.

**Compression**- A stress pressing or squeezing a structure together.

**Shear** - A stress causing a structure to collapse when contacting parts or layers of the structure slide past one another. (Shearwall, Beam Shear, Slab Punching Shear)

**Tension**- Stress placed on a structural member by the pull of forces causing extension.
4-40

A multi-brick wall.

Wythe - A single vertical stack of bricks that are most often found in

when covered by some sort of sheathing.

and vertical members usually spaced at 16 to 24 inches that is

Wood Frame - Type of construction using small wood members.

by the wind.

Wind load - Horizontal and vertical pressure imposed on a structure.

Suspended Ceiling - A ceiling built several inches or feet below the

supporting roof or floor beams above, sometimes called a "hanging"

Tensile Strength - The rated strength of a structural element or

Torsional Load - A load that causes a twisting stress on a

Tensile Stress - The tensile strength of a structural element or

Suspension Felt - Vertical structural members (2x4, 2x6 spaced 16" to 24")

which make up the walls and partitions in a frame building.

Reprints, FAQs, and Glossary

User Structures Specialist FOC
INTRODUCTION to SECTION 5

This section contains instructions for the operation of various instruments that may be used by the Structures Specialist during a US&R deployment.

Instructions and operating information are provided for the following instruments:

- Global Positioning System (60CSx) ........................................... 5-3
- Global Positioning System (62st) ........................................... 5-13
- Global Positioning System (Rino 530HCx) ......................... 5-17
- Garmin MapSource Software ................................................. 5-30
- Total Station (Nikon Model NPL 325) .................................... 5-37
- Total Station (Nikon Model Nivo 5M) ..................................... 5-49
- Wireless Building Monitoring System (WBMS) ................. 5-51
- Laser Range Meter (Hilti PD32) ............................................ 5-59
- New Laser Range Meter (Leica Disto D5 ) ....................... 5-63
- Electronic Metal Locator (Zircon MT 6) ......................... 5-64
- Digital Electronic Levels (SmartLevel & SmartTool) ....... 5-66

This information was developed to provide a quick refresher during deployment and is not meant as a substitute for formal training with each instrument. Additionally, the provided information is limited to functions and usage most common to US&R operations and is not meant as a complete documentation of each instrument’s functionality.
GLOBAL POSITIONING SYSTEM (60CSx)

General Information

- Provides a position accuracy of +/- 20 ft. under normal conditions, +/- 10 ft with WAAS enabled.

- Operates with 2-AA alkaline batteries. Each set should last approximately 24 hours of normal usage. Stored data is not lost when the batteries are removed or replaced.

- Remove the battery cover on the back of the unit by turning the metal D-ring 1/4 turn ccw.

- The 60CSx unit provides expanded memory through the use of a microSD card which is accessed by removing the batteries and sliding the metal locking clip toward the top of the unit.

Keypad Buttons

Using the GPSMAP 60CSx Keypad

**POWER Key**
- Press and hold to turn the unit on or off.
- Press and release to adjust the backlighting.

**IN/OUT Zoom Keys**
- Press to zoom in or out on the Map Page.
- Press to scroll up or down a list on any other page.

**FINB/MOB Key**
- Press and release at any time to view the Find Menu.
- Press and hold for MOB*

**MARK Key**
- Press and release at any time to mark your current location.

**QUIT Key**
- Press and release to cancel data entry or exit a page.

**ROCKER Key**
- Press up, down, left, or right to highlight options and to enter data, or move the map panning arrow.

**PAGE/COMPASS Key**
- Press and release to cycle through the main pages.
- Press and hold to turn the compass on or off.

**MENU Key**
- Press and release to view page options.
- Press twice to view the Main Menu.

**ENTER Key**
- Press and release to enter highlighted options, data or confirm on-screen messages.

*When Overboard (MOB) feature active a waypoint and the navigation back to L.
Start-Up and Satellite Acquisition

Before turning the 60CSx on, find a location that provides a clear view of the sky and allows for the acquisition of a proper number of satellites.

To turn on the 60CSx, press and hold the POWER key. At least three satellites are required to provide 2-dimensional location information and four are required to provide 3-dimensional (Latitude-Longitude-Elevation) location.

The two circles on the Satellite Page represent satellites located on the horizon (outer circle) and 45-degrees from the current position (inner circle).

Once a sufficient number of satellites have been located, the accuracy of the position data will be provided at the top of the Satellite Status Page.

If no satellites can be acquired, a dialog will appear that requests if the user desires to use the 60CSx indoors. This provides limited functionality for position but enables the unit to be loaded with maps and waypoints sets. This dialog is displayed the first time to use the 60CSx indoors. The user decides to use the 60CSx indoors. If no satellites can be acquired, a dialog will appear that requests if the user desires to use the 60CSx indoors.

Adjusting Screen Contrast and Backlighting

To turn the 60CSx off, press and hold the power key.

Adjusting Screen Contrast and Backlighting:

1. Press the red power key momentarily. A pop-up window appears for screen settings.
2. Use the ROCKER keypad to adjust screen contrast.

Satellite Status Page:
The accuracy of the position data will be provided at the top of the Satellite Status Page.

Once a sufficient number of satellites have been located, the screen contrast and/or backlighting can be adjusted. To adjust screen contrast:
1. Press the red power key momentarily. A pop-up window appears for screen settings.
2. Use the Left/Right portion of the ROCKER keypad to adjust screen contrast.

If no satellites can be acquired, a dialog will appear that requests if the user desires to use the 60CSx indoors.
3. Use the Up/Down portion of the **ROCKER** to adjust backlighting.

4. Press **ENTER** or **PAGE**, to return to the previous screen, or, press **QUIT** to cancel the settings.

**Main Display Pages**

The Garmin 60CSx uses different main display pages to provide information. The pages that are useful for US&R are:

1. **Satellite Page** – Provides the satellite signal status. At power up, this page is displayed as satellites are acquired. Three satellites are required for a two-dimensional fix (no altimeter) and four satellites are required for a three-dimensional fix.

2. **Trip Computer Page** – Provides trip and navigation data such as Trip Odometer, Maximum Speed, and Elevation. The fields can be changed by pressing the **MENU** key and using the **ROCKER** to highlight the Change Fields option. Use the **ROCKER** and **ENTER** keys to view and edit the available information for each field.

3. **Map Page** – Provides a detail map of the area surrounding the current location. Detailed maps are provide by preloading them using MapSource. Descriptive information fields provided on this page can be changed by pressing the **MENU** key and using the **ROCKER** to highlight the Change Fields option. The descriptive information fields can be assigned for both modes of the Map Page (Navigating and Not Navigating). Use the **ROCKER** and **ENTER** keys to view and edit the available information for each field.

4. **Compass Page** – Provides an electronic graphical compass and indicates direction to go and direction of travel.

5. **Main Menu** – This page provides a directory of advanced features and settings.

6. **Active Route Page** – When the 60CSx is navigating, information on this page is presented dependent on the type of navigation:
If "Follow Roads" or "Shorter Distance" is selected for navigation, the Turn by Turn route page is displayed. The ROCKER can be used to highlight each leg of the route. Pressing the ENTER key displays the turn associated with that leg.

If the "Off Road" option was selected for navigation (over Land, Sea or Air) the Electronic Compass page is displayed indicating required and current heading. When you are traveling off course the inner arrow (indicating required heading) will point in a different direction.

The internal electronic compass of the 60CSx will only work when it is actively turned on. Otherwise it will only indicate your moving position. Therefore, when the required heading is different from your current heading, you must move in the required direction. The required heading will point in a different direction than your current heading. When the Off Road option is selected, the Electronic Compass page is displayed indicating required and current heading. When navigating, the Turn by Turn route page is displayed. The ROCKER can be used to highlight each leg of the route.

There are several options that should be set or checked prior to using the 60CSx:

- **Main Menu**: Press the MENU key twice to display the Main Menu page.
- **Trip Computer Page Sequence**
- **Map**
- **Compass**
- **Satellite**
- **Setup**

Electronic Compass Calibration

It is a good idea to calibrate the Electronic Compass periodically. This is accomplished by pressing the MENU key while displaying the Compass page. Use the ROCKER to select the "Calibrate Compass" and press ENTER. Follow the instructions and rotate the 60CSx. Press ENTER when complete.

Initial Setup of the 60CSx

There are several options that should be set or checked prior to using the 60CSx:

- **Main Menu**: Press the MENU key twice to display the Main Menu page.
- **Trip Computer Page Sequence**
- **Map**
- **Compass**
- **Satellite**
- **Setup**

Electronic Compass Calibration

It is a good idea to calibrate the Electronic Compass periodically. This is accomplished by pressing the MENU key while displaying the Compass page. Use the ROCKER to select the "Calibrate Compass" and press ENTER. Follow the instructions and rotate the 60CSx. Press ENTER when complete.

Initial Setup of the 60CSx

There are several options that should be set or checked prior to using the 60CSx:
US&R STRUCTURES SPECIALIST FOG
EQUIPMENT OPERATING PROCEDURES

Ensure that WAAS/EGNOS is enabled:

<table>
<thead>
<tr>
<th>Main Menu</th>
<th>Setup</th>
<th>System</th>
<th>WAAS/EGNOS</th>
<th>Enabled</th>

</table>

(Press MENU key twice to display the Main Menu page)

Set Local Time Zone:

<table>
<thead>
<tr>
<th>Main Menu</th>
<th>Setup</th>
<th>Time</th>
<th>Time Zone</th>
</tr>
</thead>
</table>

(Press MENU key twice to display the Main Menu page)

The Time Format can also be set at this menu (12-hr vs. 24-hr).
Changing/Converting Position Format

It is important that the 60CSx be set to the correct Position Format (confirm the format in use with your team leader).

Main Menu
Satellite Setup
Trip Computer Units
Map Position
Compass Format Datum

(Press MENU key twice to display the Main Menu page)

Position coordinates can be given in several different formats. Typical formats for FEMA US&R operations are:

- Latitude/Longitude (dd:mm.mm)
- USNG

The correct Map Datum must also be selected. WGS84 is used for Latitude/Longitude (dd:mm.mm).

Marking a Waypoint

To establish a Waypoint for your current position:

1. Use the ROCKER to highlight each of the dialogue options. When the name or position options are selected, the Garmin keypad input dialogue will be displayed. Use the ROCKER to highlight the desired letter and press ENTER key to input that letter or numeral.

To establish a Waypoint for a set of given coordinates, edit the coordinates of the current position:

1. Use the ROCKER to highlight the coordinate position and press ENTER. Use the ROCKER to highlight the desired letter and press ENTER key to input the letters & numbers of the given coordinates.

To establish a Waypoint from Recently Found Location or Point of Interest:

1. Select Type Select POI Save

For both Latitude and USNG, the correct map datum must also be selected. WGS84 is used for Latitude/Longitude (dd:mm.mm).

Typical formats for FEMA US&R operations are:

Position coordinates can be given in several different formats.

Equipment Operating Procedures

FEMA US&R Structures Specialist FG
Navigation

There are three methods of navigating with the 60CSx:

- Following Roads by Fastest Time
- Following Roads by Shorter Distance
- Off Road (Land, Sea or Air)

The 60CSx will navigate to several types of locations. Without MapSource detailed maps installed, the 60CSx can navigate to Cities, Interstate Exits, Waypoints, and Recently Found places. With MapSource detailed maps installed; Points of Interest, Addresses, or Intersections are also available.

To navigate to any of the above mentioned locations:

1. Select Type Select
2. POI Go To

- A small icon will appear in the bottom left corner of the Map Display page while the 60CSx is calculating the route.
- Press the IN key to zoom in close enough to see the route.
- If either of the Follow Road options was selected, and the detailed maps for that area are not installed, there may be a significant gap in the routing directions shown on the Map Display page.
- Press the PAGE key to display the turn by turn directions for the Follow Road route.
- If the Off Road preference was selected a dark line will appear on the Map Display page indicating the course you should follow.
- Traveling direction is indicated by the small black arrow located in the Map Display page.
- The 60CSx compass is only activated while the unit is moving. It is suggested to move in one straight line for approximately ten feet noting the direction of the black arrow.
- Try to align direction of travel (the tip of the black arrow) to the dark line displayed.
Navigation (continued)

- Press the PAGE key to display the heading/course compass display page.
- The dark arrow displayed indicates the direction of travel to reach desired location. Again it is suggested to move in one straight line for approximately a large distance. The memory used for each depends on the preselected recording interval of overall travel. For example: searching a two-mile square area encompassing several city streets for the entire day may best be recorded using time at an interval of five seconds. While searching a large block area encompassing a large debris pile area encompassing several city streets for the entire day may best be recorded using time at an interval of five minutes.

Using a Track Log

The path that the 60CSx unit takes can be recorded as a Track Log and includes information about points along the path, including time and position. This feature is very useful for documenting travel in a given time period. The 60CSx automatically records its position at predefined intervals of time or distance. The track log can also be used to measure the area of any space encompassed by a path as well as retracing or tracking back along a recorded path.

Using a Track Log

The track log can also be used to measure the area of any space encompassed by a path as well as retracing or tracking back along a recorded path.

The 60CSx has memory for 20 separate saved track logs. The memory used for each depends on the preselected recording interval of overall travel. For example: searching a two-mile square area encompassing several city streets for the entire day may best be recorded using time at an interval of five seconds. While searching a large block area encompassing a large debris pile area encompassing several city streets for the entire day may best be recorded using time at an interval of five minutes.
To setup a Track Log:

- Use “Record Interval” to select the desired interval option (Distance, Time, or Auto).
- Use “Value” (or “Resolution”) to enter the desired value.
- Use “Wrap When Full” to check or uncheck this feature. (When unchecked, the track log is recorded until the available memory is full and then stops.)

To Record a New Track Log:

The 60CSx shares the data card memory with the loaded detail maps. Therefore it is suggested to remove as many unused tracks as possible. This requires that the previous tracks be uploaded through the Garmin software onto a computer having more memory. It is also suggested that the track log be “Cleared” prior to recording to ensure that only the desired data be recorded.

To Delete a Track Log:

To start recording a track, the radio button at the top of the track log screen must be on. Once the track is completed use the ROCKER to highlight the “Off” option and press ENTER once the desired path has been completed.
Using a Track Log (continued)

To Save a Track Log:

Select the waypoint you want to set, The radius defaults to 1.0 mile.

Press ENTER to open the Find Menu.

Select the Proximity icon, From the Proximity Waypoints page,
selecting a predetermine location, From the Main Menu page.

Select the Proximity icon, From the Proximity Waypoints page,
GLOBAL POSITIONING SYSTEM (62st)

General Information

- The Garmin 62st is a replacement for the 60CSx in the FEMA cache.
- Functionality is similar to the 60CSx except as noted below.

Adjusting Screen Backlighting

If lighting conditions make it difficult to see the display screen, you can adjust the contrast or turn on the backlight. To adjust screen contrast and/or backlighting:

1. Press the power key momentarily and a new window appears for screen contrast settings.

2. Use the Left/Right portion of the ROCKER to adjust screen contrast or press the power key to toggle between 3 possible setting.

The remaining battery life indicator, GPS signal strength as well as the date, time, and day of the week are also shown.

Main Display Pages

The Garmin 62 uses different main display pages to provide information. When the MENU key is pressed repeatedly a horizontal ribbon is displayed and sequenced through. Pausing on any one highlighted page will open that page. (The QUIT key will sequence backwards through the ribbon.) The following six main display pages are suggested from US&R:

1. Main Menu
2. Satellite
3. Trip Computer
4. Map
5. Compass
6. Active Route (when navigating)
The main pages displayed ribbon can be edited by:

- Main Menu
- Satellite Page Seq.
- Trip Computer Add Pages
- Map
- Compass
- Active Route

A main page can be moved or deleted by highlighting it using the Rocker and pressing the ENTER key.

- The main pages displayed ribbon can be edited by:
  - Main Menu
  - Compass
  - Trip Computer
  - Satellite
  - Main Menu
Position coordinates can be given in several different formats. Typical formats for FEMA US&R operations are:

- Latitude/Longitude Hdd.mm.mmm)
- USNG (WGS Datum)

**Marking a Waypoint**

A waypoint can be established by using the MARK key. Use the ROCKER to highlight each of the dialogue options. When the name or position options are selected the Garmin keypad input dialogue will be displayed. Use the ROCKER to highlight the desired letter and press the ENTER key to input that letter or numeral.

To establish a Waypoint for a set of given coordinates, use the FIND key and select Coordinates option. Use the ROCKER to highlight the desired letter and press the ENTER key to input the letters and numbers of the given coordinates.

To establish a Waypoint from a Recently Found location or Point of Interest, use the FIND key and select the Waypoints of Recently Found option.

**Navigation**

There are three methods of navigating with the 62st:

- Off Road
- On Road for Time
- On Road for Distance

The use of Track Logs in the 62St is similar to the 60SCx. The Track Manager is accessed from the main menu page. Options for the track logs are edited from the Tracks option from the Setup option from the main menu page.
GLOBAL POSITIONING SYSTEM (Rino 530HCx)

**General Information**

- Provides a position accuracy of +/- 20 ft. under normal conditions, +/- 10 ft with WAAS enabled.
- The built-in radio allows for voice communication up to 14 mi away (line of sight).
- Operates with a rechargeable lithium-ion battery pack with an A/C charger. A special clip (provided) must be used to charge the battery (do not lose). An optional 2- AA alkaline battery pack (transmitting power is limited to 2.0 W). Stored data is not lost when the batteries are removed or replaced.
- Remove the battery pack on the back of the unit by turning the metal D-ring 1/4 turn ccw.
- The 530HCx unit provides expanded memory through the use of a microSD card which is accessed by removing the batteries and sliding the metal locking clip toward the top of the unit.

**Keypad Buttons**

*the Rino 520/530*

- **Power button:**
  - Press and hold to turn the unit On/Off
  - Press to adjust contrast and backlighting
- **Call button:**
  - Press to send out Call, line
  - Sets the unit for a call (if enabled)
- **Talk button:**
  - Press and hold to talk
  - Ends the call when released (if enabled)
- **Page/Out button:**
  - Press to cycle through main pages
  - Used to quit or escape menu items
- **Volume (V) button:**
  - Press to open volume/squelch control
  - Press and hold to mute/squelch the speaker
- **Zoom/Map (Z) button:**
  - From the Map Page, press to open Zoom control window
  - From any other page, press to display Map Page and press again to open Zoom control
  - Press and hold to zoom the electronic compass
- **On/Off (Rino 530 only) button:**
  - Press to turn the unit On/Off
- **Microphone:**
  - Hold unit 3-4 inches away when talking
The 530HCx relies more on on-screen buttons or icons than keypad buttons. The 530HCx uses a THUMB STICK instead of a rocker and an enter button. The thumb stick is used to move a cursor around a screen, move through lists, select fields, icon, and enter data. Pressing the thumb stick activates the selection. Pressing and holding the thumb stick opens a Shortcuts Menu.

To open a display page, use the THUMB STICK to highlight the main page menu icon in the upper right corner of the screen ( ). The pages and sequencer of the pages can be modified by going to the Main Menu page and selecting Setup/Page Sequencing. The main display pages can also be opened by using the PAGE/QUIT key located below the large TALK button located on the left side of the unit. This key is also used to quit or back out of a selection.

Start-Up and Satellite Acquisition

Before turning the 530HCx on, find a location that provides a clear view of the sky and allow for the acquisition of a proper number of satellites. To turn on the 530HCx, press and hold the POWER key located on the top of the instrument between the two antenna posts. At least three satellites are required to provide 2-dimensional location information and four satellites are required to provide 3-dimensional location information. The two circles on the satellite page represent satellites located on the horizon (outer circle) and 45-degrees from the current position (inner circle). Once a sufficient number of satellites have been located, the accuracy of the position data will be provided at the top left of the screen.
If no satellites can be acquired, a dialog box will appear that requests if the user desires to use the 530HCx indoors. This provides limited functionality for position but enables the unit to be loaded with maps and waypoint sets. With the Satellite Status Page Options displayed, use the THUMB STICK keypad to highlight “Use With GPS Off” and press the THUMB STICK keypad.

To turn the 530HCx off, press and hold the power key.

**Adjusting Screen Contrast and Backlighting**

If lighting conditions make it difficult to see the display screen, you can turn on the backlight by momentarily pressing the POWER key. Pressing the POWER again, causes a pop-up window to appear that allows adjustment of the backlighting brightness with the THUMB STICK. Use the PAGE/QUIT key to exit.

**Main Display Pages**

The 530HCx uses different main display pages to display information. With the exception of the Mail Menu page, page options can be changed by selecting Menu-Option on-screen button to the left of the main page menu button. Six pages are suggested for US&R operations:

1. **Satellite Page** – Provides the satellite signal status. Three satellites are required for a two-dimensional fix (no altimeter) and four satellites are required for a three-dimensional fix.

2. **Trip Computer Page** – Provides trip and navigation data such as Trip Odometer, Maximum Speed, and Elevation. The fields can be changed by highlighting the field and selecting from the list options using the THUMB STICK.

3. **Map Page** – Provides a detail map of the area surrounding the current location. Detailed maps are provide by preloading them using MapSource.

4. **Compass Page** – Provides an electronic graphical compass and indicates direction to go and direction of travel.

5. **Main Menu** – This page provides a directory of advanced features and settings.
6. Radio Page – This page allows communication with other radio units. When in radio mode, the radio icon is displayed in the top left corner of the screen. To switch between radio and other pages, press the “Main Menu” button. The page sequence is as follows:

- Main Menu
- Trip Computer
- SatCom
- Page Sequence
- Compass
- Setup
- Compass

Main Menu (continued)

Main Page Display Pages (continued)

Equipment Operating Procedures
Electronic Compass Calibration

While at the Compass page, click on the Option Menu icon and select the Calibrate Compass option. The device must be slowly rotated in a horizontal plane two times.

Initial Setup of the 530HCx

There are several options that should be set or checked prior to using the 530HCx:

Ensure that WAAS is enabled:

<table>
<thead>
<tr>
<th>Main Menu</th>
<th>Satellite Setup</th>
<th>Trip Computer System</th>
<th>Map</th>
<th>Compass System</th>
<th>Radio</th>
</tr>
</thead>
<tbody>
<tr>

</table>
Initial Setup of the 530HCx (continued)

Set map page orientation North Up:

Set local Time Zone:

The Time Format can also be set at this menu (12-hr vs. 24-hr).

Changing/Converting Position Format

It is important the 530HCx be set to the correct Position Format (confirm the format in use with your team leader).
Position coordinates can be given in several different formats. Typical formats for FEMA US&R operations are:

- Latitude/Longitude (Hdd.mm.ss or Hdd.mm.mmm)
- USNG

The correct Map Datum must also be selected. WGS84 is used for both Lat/Long and USNG.

**Marking a Waypoint**

To establish a Waypoint for your current position, push and hold the THUMB STICK to reveal the Shortcuts window, select Mark Waypoints (can also Mark from the Main Menu page). Edit the displayed information as required and select OK.

To establish a Waypoint for a set of given coordinates, mark a waypoint for the current position as described above and edit the coordinates as required using the THUMB STICK.

To establish a Waypoint from a Recently Found location or Point of Interest, push and hold the THUMB STICK to reveal the Shortcuts window, select Find, and then select either Recent Find or All Points of Interest. (The Find option can also be selected from the Main Menu page.)

**Navigation**

There are three methods of navigating with the 530HCx:

- Following Roads by Fastest Time
- Following Roads by Shorter Distance
- Off Road (Land, Sea or Air)

The 530HCx will navigate to several types of locations. Without MapSource detailed maps installed, the 530HCx can navigate to Cities, Interstate Exits, Waypoints, and Recently Found places. With MapSource detailed maps installed; Points of Interest, Addresses, or Intersections are also available.
To navigate to any of the above mentioned locations, press and hold the **Thumb Stick** key.

The **Thumb Stick** can be used in navigating each leg of the route. The Thumb Stick is only activated while the unit is moving. It is suggested to move in one straight line for approximate navigation only noting the direction of the black arrow.

**Traveling direction is indicated by the small black arrow located on the Map page.**

If the Off Road preference was selected a dark line will appear on the Map page indicating the course you should follow.

Select the **Active Route** page to display the turn by turn directions for the Follow Road route.

If the Off Road preference was selected a dark line will appear on the Map page indicating the course you should follow. It is recommended to move in one straight line for approximately navigating only noting the direction of the black arrow.

The 530HCx compass is only activated while the unit is moving. It is suggested to move in one straight line for approximately navigating only noting the direction of the black arrow.

Say the **Thumb Stick** key to display the turn associated with that leg.

**Traveling direction is indicated by the small black arrow located on the Map page.**

If either of the Follow Road options was selected, and the travel direction is indicated by the small black arrow located on the Map page, significant gap in the routing directions shown on the Map page may be a detailed map for that area are not included. There may be a detailed map for that area are not included. There may be a

To navigate to any of the above mentioned locations, press and hold the **Thumb Stick** key and select **Find** or use the Main Menu page:

<table>

Navigation (continued)

**User Structures Specialist FOG**

**Equipment Operating Procedures**

2-3-4
b. If the “Off Road” option was selected for navigation (over Land, Sea or Air) the Electronic Compass page is displayed indicating required and current heading. When you are traveling off course the inner arrow (indicating required heading) will point in a different direction.

The internal electronic compass of the 530HCx will only work when it is actually turned on. Otherwise it will only relate your moving position. Therefore when the compass is off you must travel at least ten feet in order for the unit to provide accurate heading information.

- Select the Compass page. The dark arrow displayed indicates the direction of travel to reach desired location. Again it is suggested to move in one straight line for approximately ten feet noting the direction of the black arrow.

**Using a Track Log**

The path that the 530HCx unit takes can be recorded as a Track Log (bread crumb trail) and includes information about points along the path, including time and position. This is accomplished by the 60CSx automatically recording its position at predefined intervals of time or distance. This feature is very useful for documenting travel in a given time period. (i.e. houses searched in a neighborhood for a specific day).

The track log can also be used to measure the area of any space encompassed by a path as well as retracing or Tracking Back along a recorded path.

The 530HCx has memory for 20 separate saved track logs with 500 points each. The memory used for each depends on the preselected recording intervals. The interval chosen should depend on the anticipated amount of overall travel. For example: Searching a two-mile square area encompassing several city streets for the entire day may best be recorded using Time at an interval of five minutes. While documenting a city block area encompassing a large debris pile may best be recorded using Time at an interval of 5-seconds.
**To setup a Track Log:**

- Use "Record Method" to select the desired interval option (Distance, Time, or Auto). (Press Page/Quit key to display the Main Menu page)
- Use "Interval" to enter the desired value.
- Use "Wrap When Full" to check or uncheck this feature. (When unchecked, the track log is recorded until the available memory is full and then stops.)

**To Record a Track Log:**

The 530HCx shares the data card memory with the loaded detail maps. Therefore it is suggested to remove as many unused tracks as possible. This requires that the previous tracks be uploaded to a computer having more memory. It is also suggested that the track log be cleared prior to recording to ensure that only the desired data be recorded.

To delete a Track Log:

- Press Page/Quit key to display the Main Menu page

To start recording a track, the radio button at the top of the track log screen must be on. Once the track is completed use the THUMB STICK to highlight the "Off" option.
To Save a Track Log:

- The track log is saved using the current date. A different name can be input by using the THUMB STICK to highlight the Name option.
- Use the THUMB STICK to highlight the desired letters and press the THUMB STICK to input that letter or numeral.
- Information (distance, number of points, and enclosed area) for the track log is presented on this page.
- The units used for calculating area can be adjusted by using the THUMB STICK to highlight the unit and pressing the THUMB STICK.
- Other options available on this page are: Show On Map – permanently displays a dotted line on the Map Display page. Delete – deletes the recorded log. Map – temporarily displays the recorded log on the Map. Track Back – provides a point by point set of directions for following the recorded track back to its origin.
Using the Radio Features

The 530HCx allows voice communication between units as well as transmitting one's location and receiving contact information from other units. Two types of radio frequencies are available:

- **GMRS** – General Mobile Radio Service (Channels 1-7, 15-22) - This uses a repeater channel (15R-22R). The repeater channels are not a scrambler, but will allow for the transmission of voice information. The GMRS frequencies on the 530HCx can broadcast with a maximum 5 Watts output. Each GMRS frequency has 38 squelch codes. These codes allow the 530HCx to filter out other traffic on the same frequency. Set the squelch code to zero to hear all the activity on the selected channel. However, you must be set to the same code as the other unit to transmit back.

- **FRS** – Family Radio Service (Channels 8-14) - The FRS is generally unregulated and requires no license to use. The FRS is generally used for short-range, peer-to-peer communications. There are 8 repeater channels (disabled by default) for use with an operating repeater (channels 15R-22R). The repeater channels will not broadcast peer-to-peer position information.

GMRS - General Mobile Radio Service (Channels 1-7, 15-22)
FRS - Family Radio Service (Channel 8-14)

The 530HCx allows voice communication between units as well as transmitting one's location and receiving contact information from other units.
The 530HCx does allow for secure communications. This is accomplished by turning on “Scramble” on the Radio Setup screen. Both units must be set up identically for the two units to communicate.

Peer-to-Peer Positioning:

A useful feature of the 530HCx is its ability to transmit its position to other 530HCx units (positioning is updated every 30 seconds or when the Call key is pressed). If this option is selected, your user symbol will appear on the map page of other units that have given permission to be added to their contact list. To enable position information to be sent from your unit:

<table>
<thead>
<tr>
<th>Radio</th>
<th>Main Menu Setup</th>
</tr>
</thead>
<tbody>
<tr>
<td>Satellite</td>
<td>Send Location</td>
</tr>
<tr>
<td>Trip Computer</td>
<td>Yes</td>
</tr>
<tr>
<td>Map</td>
<td></td>
</tr>
<tr>
<td>Compass</td>
<td></td>
</tr>
</tbody>
</table>

(Press Page/Quit key to display the Main Menu page)

When a signal is first received from another 530HCx unit, a New Contact page will appear. By selecting MAP, the new contact will appear on your Map page. To navigate to a contact, select the contact from the list on Map page and select GO TO.
Necessary to interface a Garmin GPS unit (including the GPS 60CSx, 62st, and 530HCx) with a computer.

- Used to upload geographical data, such as detailed maps, as well as downloading waypoints, routes, and associated information obtained in the field.
- Various mapping products are available for use with Garmin MapSource:
  - USA TOPO
  - BlueChart
  - City Navigator
  - City Select
  - City Navigator (more detailed than City Select)

Garmin MapSource software is provided primarily for the City Select mapping product. Various mapping products are available for use with Garmin MapSource:
- USA TOPO
- BlueChart
- City Navigator
- City Select
- City Navigator (more detailed than City Select)

Creating Map Sets

Geographical information must be contained in a Map Set in order to be uploaded to a GPS unit. A Map Set is one or more detailed area maps that have been selected from the Garmin Map. City Select divides the United States into detailed area maps of varying sizes depending on the population and development densities. The following information is provided primarily for the City Select mapping product (see p. 5-37 for typical MapSource window display of the City Select – North America product).

Comments on the Use of Garmin Software

- Most of the Garmin software must be unlocked with a 25-digit code in order to be installed on a computer.
- Uploading of information to a Garmin GPS unit should be done prior to mobilization, if at all possible.

Graphic Maps

The Graphic Map is the display of the currently selected geographical information within MapSource. The view can be changed by either zooming in or out, or by panning in all directions. These view changes can be done using the on-screen scroll bars, keyboard’s arrow keys, or the Hand tools.
US&R STRUCTURES SPECIALIST FOG
EQUIPMENT OPERATING PROCEDURES

1. Select a zoom scale that allows viewing of the map area boundaries.

2. Select “Map” from the Tools menu or the “Map” tool icon in the Tools toolbar. The map area boundaries will be outlined in yellow when the Map tool is located with a detailed map.

3. Click the left mouse key in the selected area. To select several map areas, drag the mouse to draw a box through the different areas. Selected map areas are shaded in pink.

4. Selected map areas are given in listed in the Maps tab on the left of the screen along with the memory requirements for each map area.

5. Ensure that the total memory requirement, given at the bottom of the Map tab does not exceed the memory capacity of the GPS unit (Garmin 60CS = 56 Mb, Garmin 60CSx = func of storage card).

6. Save Map Set by selecting “Save” in the File menu. Map Sets, along with associated waypoints, routes, etc., are saved as GPS data files have the .gdb file extension.

Creating a Waypoint on the Graphic Map

Waypoints can be created within the MapSource program using geographical information for later uploading to a GPS unit:

1. Select “Waypoint” from the Tools menu or the “Waypoint” tool icon in the Tools toolbar.

2. Position the mouse pointer at the desired location for the waypoint on the Graphic Map.

3. Left-click the mouse, or right-click the mouse and select “New Waypoint.” In either case, the “Waypoint Properties” dialog box will open.

4. Make any desired changes to the “Waypoint Properties,” then click “OK” to save the new waypoint.
Creating a Waypoint using Known Coordinates

A waypoint can be created within the MapSource program using known coordinates of a location for later uploading to a GPS unit:

1. Select "Waypoint" for the Tools menu. The "Waypoint Properties" dialog box will open.
2. Edit the waypoint name and enter a description, if desired. Note that Garmin GPS units can only display a limited number of characters. Names that are too long are truncated for display on the GPS unit.
3. Enter the coordinates of the new waypoint. Only a single space is used to separate the N and E decimal coordinates.
4. The new waypoint can be shown on the Graphic Map by clicking the "Show on Map" key at bottom right of dialog box.
5. The following options may appear by clicking the right mouse key on a waypoint in the Waypoints tab list:
   - Move Waypoint: Activates the Selection tool and allows you to move the selected waypoint to another location on the Graphic Map.
   - New Waypoint: Begin Route, Begin Measurement, Find Nearest Move Waypoint: Activates the Selection tool and allows you to move the selected waypoint to another location on the Graphic Map.
   - Remove Waypoint from Route: Selecting this option removes the selected waypoint from the route, but does not delete the waypoint itself.
   - Cut/Copy/Paste: Allows one to cut, copy, and paste waypoints from one active MapSource document to another.
   - Delete Waypoint: Deletes the selected waypoint.
   - Show Selected Waypoint on Map: Zooms to the selected waypoint and centers it on the Graphic Map.
   - Waypoint Properties: Activates the "Waypoint Properties" dialog box, allowing for their review and editing for the selected waypoint.
   - Create copy/Paste: Allows one to cut, copy, and paste waypoints from one active MapSource document to another.

Waypoint Right-Click Menu

Click OK to record the waypoint.
Creating Routes
Routes can be created in MapSource for uploading to a GPS unit. Routes are either direct (straight-line) or an automatic route (turn-by-turn) (default for City Select).

1. Select “Route” from the Tools menu or the “Route” tool icon in the Tools toolbar.
2. Click on waypoints or map locations on the Graphic Map in the sequence required for the route. If a waypoint does not exist on the map, a new waypoint will be created. Route legs are created as direct lines between waypoints.
3. After end point of route has been entered, press Esc or right-click the end point and select “Cancel.” The route is created and automatically named using the names of the first and last waypoints.
4. The total distance of the route is given in Route tab list.
5. Properties of the route can be edited by right-clicking the route in the Route tab list and selecting “Route Properties...”

Determining Distance/Bearing Between Two Waypoints
The straight-line distance and bearing between two points can be determined using MapSource:

1. Select “Distance/Bearing” from the Tools menu or the “Distance/Bearing” tool icon in the Tools toolbar.
2. Click on the point of origin waypoint or map location then move mouse cursor to termination point. Distance and bearing to the termination point is displayed at the bottom of the MapSource window.
3. By clicking on the termination point, additional points can be added but the bearing is measured from the beginning point while the distance is measure along the series of segments.
Transferring MapSource Data to a GPS Unit

Map Sets currently saved on Garmin GPS unit are replaced.

1. Attach USB cable between computer and GPS unit.
2. Select "Save To Device ..." in the Transfer menu or click on the "Send To Device" icon in the Tools toolbar.
3. In the "What to Save" dialog box, select the drive letter in the "Storage Card Reader" dialog box.
4. If saving to a storage card, select the drive letter in the "Storage Card Reader" dialog box.
7. Click "Save" to begin transfer of data. The GPS unit can be automatically turned off upon completion of the date transfer by placing a check mark in the box just above the "Save" key.

Note: Map Sets currently saved on a Garmin GPS unit are replaced upon completion of the date transfer by placing a check mark in the box just above the "Save" key.
**Transferring MapSource Date from a GPS Unit**

Maps, waypoints, routes, and tracks can be downloaded from a Garmin GPS unit (or storage card) to the MapSource program:

1. Attach USB cable between computer and GPS unit.
2. Select “Receive From Device …” in the Transfer menu or click on the “Receive From Device” icon in the Tools toolbar and choose the device type. A different dialog box will appear depending on the attached GPS unit.
3. In the “What to Save” dialog box, select the date type for transfer by placing a check mark in the box(se) next to the type of data to be transferred.
4. If transferring from a storage card, select the drive letter in the “Storage Card Reader” dialog box.
5. Click “Save” to begin transfer of data. The GPS unit can automatically turned off upon completion of the date transfer by placing a check mark in the box just above the “Save” key.

**Real-Time Tracking**

MapSource can read information for a GPS unit in real time. The location of the GPS unit is shown as a red triangle on the Graphic Map, tracking data is displayed on the GPS tab and the track is recorded.

1. Attach serial or USB cable between computer and GPS unit.
2. Set the “USB Data Format” on the GPS unit to either Garmin or NMEA format.
3. Select the GPS tab in MapSource and click “Select Device.” Select the proper connection type.
4. Check the “Record Track” box and MapSource will begin to track the movement of the GPS unit.
5. To have MapSource automatically adjust the Display Map to keep the GPS unit visible on the Graphic Map, check the box next to “Keep Vehicle Visible on Map.”

5-35
TOTAL STATION (Nikon NPL-352 or Nivo 5M)

- A Total Station can determine XYZ coordinates.
- Distances of approximately 300 ft. can be measured without the need for a prism at the point measured. Greater range can be obtained using a prism or a reflector-type target.
- Some keys have menus specific to their function. These menus can be shown by pressing the key in question down for 3 seconds. Nikon refers to these keys as "1-second keys".
- Sometimes options are given in the display on the keyboard. These options appear at the bottom of the screen and can be selected by pressing one of the white keys below the screen. These are called "soft keys" by Nikon.
- The display window of the total station can show four different data screens. Nikon calls these the Basic Measurement Screens (BMS). The screens are indexed in the upper right corner as 1/4, 2/4, 3/4 and 4/4. Most applications of the total station for US&R purposes use screen 4/4, which displays the XYZ coordinates. Pressing the DSP key toggles between the different BMS screens. The up and down cursor keys can also be used to navigate through the BMS screens.

Initial Setup Procedure

1. Set the tripod at a proposed station location without the total station attached:
   - With the legs together, extend them to chin height.
   - Spread the legs so tripod mounting surface is approx. level.
   - Set the far leg first, spacing the other two legs to level.
   - Snugly fasten all the leg clamps, but do not over-tighten.

2. Remove the total station from the carrying case and mount it on the tripod. Insert the tripod mounting screw into the center hole of the base plate of the instrument, and snugly fasten the screw, but do not over-tighten.

3. Level the total station by loosening a tripod leg clamp and adjusting the leg length until the air bubble is in the center of the circular level, (bull’s-eye level). Lengthening a leg moves the bubble towards that leg.
The Nikon NPL-352 Initial Setup Procedure (continued)

4. The NPL-352 can be leveled further by using the procedure described in the Leveling section below (see page 5-45).

5. Turn on the total station by pressing the PWR key. The Tilt Telescope screen will appear showing the current date and time, and the last values set for temperature and pressure.

6. Press the softkey (the white MSR2 key) under SET to get to the BMS screen. The display window should now be showing BMS screen 4/4 (also see Sighting section below, page 5-46).

7. Focus the telescope cross hairs by adjusting the smaller knurled ring of the eyepiece. This provides consistent sighting of targets (also see Sighting section below, page 5-46).

8. The Job Manager screen to get to the Create Job screen.

9. The display window should now be showing BMS screen 4/4.

Press the MENU key and select "1.Job" to get to the Job Manager screen. A new job is created by pressing the softkey (the white MSR1 key) under "1.Job" (or scroll to highlight "1.Job" and press the REC/ENT key).

Create a New Job

1. Press the MENU key and select "1.Job" to get to the Job Manager screen. A new Job is created by pressing the softkey (the white MSR1 key) under "Creat" on the Job Manager screen to get to the Create Job screen.

2. Each Job requires a unique name. Use the default Job name which appears in the Create Job screen (the date YYMMDD followed by a dash and a sequential digit). Press the REC/ENT key once. Read what is written on the screen.

3. Press the softkey (the white MSR2 key) under SET to get to the BMS screen. If the Job Manager screen is displayed, use the DSP key to go back to the Job Manager screen and press theREC/ENT key (or scroll to highlight "1.Job" and press the REC/ENT key).

4. Press the softkey (the white MSR2 key) under "Sett" to get to the Job Settings screen.
Create a New Job (continued)

The job settings can only be changed at this time. The default settings suggested for US&R use are:

- **Scale:** 1.000000
- **T-P corr:** ON
- **Sea Level:** OFF
- **C&R Corr:** 0.132
- **Angle:** DEG
- **Distance:** US-Ft (Decimal-Ft)
- **Temp:** °F
- **Press:** inHg
- **VA zero:** Zenith
- **AZ zero:** North
- **Order:** ENZ
- **HA:** Azimuth

Use the left and right scroll keys to change an incorrect setting. Press **REC/ENT** after each setting is verified. After pressing the **REC/ENT** key for **HA: Azimuth**, you return to the **BMS**, completing the creation of the new Job.

4. Now check the coordinate ordering and labeling convention. Press the **MENU** key and select **“3.Settings”** by pressing the **3** key. Select **“3.Coord.”** by pressing the **3** key again. **Order** should be set to **“ENZ”**, **Label** should be set to **“XYZ”** and **AZ zero** should be set to **“North”**. Press **REC/ENT** after each setting is verified. After pressing the **REC/ENT** key for **AZ zero**, you return to the **Settings** screen.

5. While still on the **Settings** screen, check the data recording format. Select **“8.Rec”** by pressing the **8** key. **Store DB** should be set to **“RAW+XYZ”**, and **Data Rec** should be set to **“Internal”**. Press **REC/ENT** after each setting is verified. After pressing the **REC/ENT** key for **Data Rec**, you return to the **Settings** screen.
Create a New Grid (Create a New Station)

Press REC/ENT after each setting is verified. After pressing REC/ENT for Rec mode, you return to the BMS screen.

### MSR1
- **Rec Mode:** MSR only
- **Target:** N-Prism
- **N-Prism:** 0
- **Prism Constant:** 0
- **Mode:** Normal
- **AVE:** 1

### MSR2
- **Rec Mode:** MSR only
- **Target:** N-Prism
- **N-Prism:** 0
- **Prism Constant:** 0
- **Mode:** Normal
- **AVE:** 1

### Create a New Grid (Create a New Station) (continued)

- **Creating a New Station:** The known point can be arbitrarily determined.
- **Creating a New Grid:** The orientation of the grid and the coordinates of the known point are needed. The orientation of the grid and the coordinates of the known point are entered into the grid. The coordinates of the known point are entered into the grid.

1. Having created a new Job, a new grid can be created.

2. **Pressing REC/ENT:** After each setting is verified. After pressing REC/ENT for Rec mode, you return to the BMS screen.

3. **Configure the MSR1 and MSR2 keys.** To enter/exit settings, hold the MSR1 key down for 3 seconds. These settings can be changed at any time. Hold the MSR1 and MSR2 keys. These settings can be changed at any time.

4. **Configure the MSR1 and MSR2 keys.** To enter/exit settings, hold the MSR1 key down for 3 seconds. These settings can be changed at any time.

5. **Press the ESC key again to return to the BMS.**

6. **While still on the Settings screen, check the data displayed.**
Create a New Grid (continued)

2. Use the center of the instrument as the new Station. Press the STN key (the 7 key). Select “1.Known” by pressing the 1 key. Number this Station as 1 (ST: 1), then press REC/ENT. Input assumed coordinates for the new Station (use X = 1000 ft, Y = 100 ft, and Z = 10 ft) and press REC/ENT after entering each coordinate. The cursor will skip to the CD line. Leave it blank and press REC/ENT to return to the Input Station menu.

3. Enter the height of instrument as zero (HI: 0), press REC/ENT.

4. The next screen displayed is the Backsight (BS) screen. A BS is used to orient the grid. Select “2.Angle” by pressing the 2 key. This brings you to the Input BS Point screen. Number the BS as 9, press REC/ENT. Enter zero for the height of the target (HT: 0), press REC/ENT. This brings you to the Input BS Angle screen. Enter zero for the azimuth angle (AZ: 0), press REC/ENT. Now the orientation of the total station must be established. For US&R use, select a BS point that is forward of the total station (towards the building being monitored). Sight through the telescope so the line of sight is approximately perpendicular to the face of the building to be monitored (this will roughly align the X Y grid with the building layout) and press REC/ENT. This returns you to the BMS. It is not necessary to measure the location of the BS point as it is only used for the initial orientation of the grid.

5. The instrument can now measure and record point coordinates.

Sighting and Measuring Points

1. Loosen both the horizontal and vertical tangent screws.

2. Ensure that the telescope focuses properly. (See page 5-46).

3. Use the optical sight on top of the telescope to roughly point the telescope at the target.
Sighting and Measuring Points (continued)

4. Snug the horizontal tangent screw. Do not over tighten.

5. Look through the eyepiece and move the telescope vertically until the target is in view.

6. Snug the vertical tangent screw. Do not over tighten.

7. Rotate the focusing ring to bring the target into sharp focus on the eyepiece crosshairs.

8. While looking through the telescope, use the horizontal and vertical crosshairs to sight the telescope crosshairs on the target.

9. Press either MSR1 or MSR2 to take a measurement.

Reviewing Previously Recorded Data

and Monitoring Points

Press the ESC key. The data for this point is now available in the memory of the total station.

Press the DATA key (the 6 key). Press the DATA key (the 6 key). Scroll to the point you want to view and press REC/ENT. The data for this point is now reviewed. Press the DATA key (the 6 key). Scroll to the point you want to view and press REC/ENT.

When X, Y, Z coordinates are displayed on BMS Screen 4/4, press the DATA key (the 6 key). Scroll to the point you want to view and press REC/ENT.

The data for previously recorded points can be viewed in the DATA screen. Press the DATA key (the 6 key). Scroll to the point you want to view and press REC/ENT.

The point list screen is displayed by pressing the ESC key.

Press the ESC key (the 0 key). Scroll to the point you want to view and press REC/ENT.

The data for this point is now displayed. Exit the point data screen by pressing the ESC key. Exit the point data screen by pressing the ESC key. Exit the point data screen by pressing the ESC key.
Reviewing Previously Recorded Data (continued)

The DAT screen data format can be changed. Starting in the BMS screen, hold the DAT key (the 6 key) down for 3 seconds to enter/check the data reporting format. The format should be "3.XYZ data". Change it to "3.XYZ data" by pressing the 3 key. If it is already set to "3.XYZ data" use the ESC key to exit out of this option. If you change it from another option you are taken directly to the XYZ data screen. Exit this screen by pressing the ESC key.

Building Monitoring Setup

Building movement should be monitored with the coordinate system or grid aligned to the building plan.

Control points should be numbered using two digits (10, 20, etc.). Monitoring points should be numbered using three digits (100, 200, etc.). After additional measurements are taken on the same monitoring point or control point, the number of the recorded point should be incremented (Point 100 becomes 101, 102, etc. or Point 10 becomes 11, 12, etc.) when the point is recorded.
Building Monitoring Setup (continued)

Sight and record monitoring points on the building to begin the monitoring process. Establish these control points by resighting them at regular intervals. Ensure all sightings are properly recorded. Control points should be established immediately after the points are surveyed. Control points established in an existing grid will be闪耀 within the current job. The control points will be recorded within the job as they are established.

2. Move the total station to a new location on a grid. The new location will be established from the old location and its coordinates within the grid can be seen from the new location. The coordinates of the new location will be the center of the new location.

3. Set up and level the total station at the new instrument point. Given control of the total station and the new location, set up the total station.

Option No. 7 Known Line Method. This method uses any two points as PT1 and PT2.

1. Input the coordinates of the known points to be used for PT1 and press REC/ENT.

2. If the known point has been recorded within the current job, press REC/ENT to accept these coordinates. If it has not been recorded, input the point's coordinates and press REC/ENT after entering each coordinate.

3. When the coordinates have been entered, press REC/ENT to accept these coordinates. If the coordinates have not been entered, input the point's coordinates and press REC/ENT after entering each coordinate.

4. Move the total station to the new location. The new location will be established from the old location.

5. Set up and level the total station at the new location.

Moving the Total Station Within an Existing Grid

There are several methods available to move the total station to a new location. The following method is recommended below for US&R building monitoring.

Option No. 7 Known Line Method. This method uses any two points as PT1 and PT2.

1. Input the coordinates of the known points to be used for PT1 and press REC/ENT.

2. If the known point has been recorded within the current job, press REC/ENT to accept these coordinates. If it has not been recorded, input the point's coordinates and press REC/ENT after entering each coordinate.

3. When the coordinates have been entered, press REC/ENT to accept these coordinates. If the coordinates have not been entered, input the point's coordinates and press REC/ENT after entering each coordinate.

4. Move the total station to the new location. The new location will be established from the old location.

5. Set up and level the total station at the new location.

Building Monitoring Setup (continued)
Moving the Total Station within an Existing Grid (continued)

Enter HT = 0.0. Press REC/ENT. The cursor will move to the CD line. Leave the CD line blank and press REC/ENT to return to the Input PT1 screen.

4. The known point used as PT1 must now be sighted and measured. Sight the point and press MSR2 or MSR1 and then press REC/ENT after the instrument has completed the distance measurement.

5. Select option “1. By Coord” by pressing the 1 key.

6. Input the point number of the known point to be used for PT2. If the point has already been recorded in the current Job, the coordinates will be shown after REC/ENT is pressed. Otherwise, input the point number, press REC/ENT, enter the known point coordinates, and press REC/ENT after each entry.

7. Enter HT = 0.0 Press REC/ENT.

8. Sight the point and press MSR2 or MSR1 and then press REC/ENT after the instrument has completed the distance measurement.

9. The new location of the total station on the existing grid is now shown in the display screen. Press REC/ENT to record these coordinates.

10. A default number for this station is displayed. Delete that number and enter a new station number for this point (2000 for example) and press REC/ENT. We are using the center of the total station as the position of the point, so HI = 0.00 and press REC/ENT. Leave the CD line blank and press REC/ENT. The cursor moves to the BS line, which displays the point number of the point used for PT1. Accept this by pressing REC/ENT.

11. The total station is now oriented on the original coordinate grid.

12. If it becomes desired to verify if the total station has moved, repeat steps 2 through 10 without moving the total station. Use a new station number for this point (2001 for example), as the coordinates for point 2000 are already set.
Leveling – (Additional, available on NPL-352 only)

1. Un-snug the horizontal tangent screw.
2. Rotate the alidade until the plate level is parallel with any two of the three leveling posts.
3. Use these two leveling posts to move the bubble to the center of the level. Note: bubble moves in the direction of left thumb.
4. Rotate the alidade approximately 90° and use the third post to move the bubble to the center of the level. Note: bubble moves in the direction of left thumb.

Sighting Adjustments

To measure distances accurately, the total station must be properly adjusted and focused.

- To bring the telescope crosshairs into sharp focus, aim the telescope at a blank area, such as a piece of paper. Look through the objective until the image of the crosshairs is sharp.
- To bring the telescope crosshairs into sharp focus, aim the telescope at a blank area, such as a piece of paper. Look through the objective until the image of the crosshairs is sharp.
- To check for parallax, sight the telescope at the target image. Rotate the focusing ring (largest ring between the eyepiece and the telescope body) to bring the target image into sharp focus on the crosshairs.
- To check for parallax, sight the telescope at the target image. Rotate the focusing ring (largest ring between the eyepiece and the telescope body) to bring the target image into sharp focus on the crosshairs.

Instrument Handling

- Always carry the instrument in its case.
- Do not carry the instrument from the top handle.
- When leaving the instrument set up, place the lens cap on and cover the whole instrument with the vinyl cover.
- Protect the instrument against the weather.
- During transportation always place accessories in their correct position to prevent displacement.
- Leveling (Additional, available on NPL-352 only)
Drying a wet instrument

- Wipe the total station carefully, remove the foam inserts from the case and let them dry out completely.
- Allow the total station to air-dry before it is returned to its case. This prevents the telescope optics from fogging.

Changing Batteries during Use

If it becomes necessary to change batteries on an NPL-352 while using the total station, follow the procedure given below:

- Sight the telescope on a known or control point and snug the tangent screws.
- Turn off the total station and replace the battery.
- Before turning the total station back on, assure that the telescope is still locked on the known or control point.
- Turn the total station back on. Re-measure the known or control point to verify that the total station is still oriented correctly to the grid.

The Nikon Nivo 5M is smaller and lighter than the NPL-352. Under ideal conditions, the Nivo 5M is capable of a maximum measured distance of 900 ft in reflectorless mode.

The Nivo 5M is similar and lighter than the NPL-352.
US&R STRUCTURES SPECIALIST FOG
EQUIPMENT OPERATING PROCEDURES

WIRELESS BUILDING MONITORING SYSTEM (WBMS)

The Wireless Building Monitoring System (WBMS) allows monitoring and detection of the tilt angle of various building structures. It is intended to provide a remote sensor for use at an emergency rescue site where these structures may be unstable. The system displays angular tilt information on an Android Based Player, Smartphone or Tablet.

Email questions or suggestions to: admin@disasterengineer.org

Shipping Container Contents

There are 2 shipping containers for each four-sensor system. Each container has the following equipment:

1) 2 Sensor Units
2) 1 Receiver Unit
3) 2 Sensor External Battery Units
   (Various 12v batteries may be used including an Auto Battery)
4) 2 AC Charging Cables
5) 2 Battery Unit to Sensor Unit Power Cables
6) 1 Android Interface Unit (Samsung Galaxy 5 Player with Android 2.3 Operating Sys) and Charger
7) 1 Extended-life battery for Interface Unit
8) 1 Earpiece
9) Users Guide and Software

System Pre-Test & Operation

Prior to mounting the Sensor Units to structural members, a system pre-test is highly recommended.

1. Unpack the system shipping container.
2. Verify that the Interface Unit, Receiver Unit, and Sensor Unit batteries are fresh or fully charged. The Android Interface Unit uses its own battery (an extended life battery may be available). The Receiving Units operates on 8 – AA batteries. The Sensor Units operate on an external battery (USACE WBMS sensor units have optional AA internal batteries)
3. If using external Battery Units, connect the Sensor Unit to the external power plug. Do not force the connection to the sensor unit – rotate the plug until the pins are aligned and it will slide into position quite easily.

4. Turn on the receiver switch for one of the Receiver Units (prior to powering on the Interface Unit).

5. Turn on the Android Interface Unit. Verify that the Bluetooth symbol is present in the upper right corner of the display next to the battery symbol. If not, the Bluetooth is enabled by going to Settings, Wireless and network, Bluetooth settings.
6. Select WBMS from the Applications screen – the WBMS home screen will appear.

7. From the home screen of the WBMS application, select Connect Receiver. On the next screen, tap Scan for devices at the bottom of the screen. Select the device that corresponds to label on your Receiver Unit. (If multiple Receiver Units are powered on, multiple units will appear on the screen. Note that both Receiver Units can monitor all 4 sensor units at the same time, however an Interface Unit can be paired with only one Receiver Unit at a time.)

   If “No devices are found,” return to the WBMS home screen using the return arrow of the device, verify that the receiver box is powered on, and repeat this step. If again no devices are found, exit the WBMS application and toggle the Bluetooth connection off and on as described in step 5, then restart the WBMS application and repeat this step.

   A successful connection will be indicated by text in the blue bar across the top of the home screen “Connected – Receiver ##” where ## is the number of the Receiver Unit, e.g. 7A.
6. From the WMS Home screen, select Control Center to view the status of all sensor units. Verify that all the desired sensors are functioning as intended.

9. Tap the circular arrow in the middle left of the screen to zero the sensors. It may take up to six seconds for this function to be completed. Any alarm conditions will be silenced when the units are zeroed.

10. Tap the left arrow to return to the WMS main menu.

11. Tap Reset Triggers to access the alarm menu. Tap a value to change it. With the pop-up keyboard, type in the desired value then tap the U-shaped return key on the droid device. Then tap the up/down arrow on the alarm menu to upload the new alarm threshold to the sensor box. Repeat for both axes of each active sensor. If desired, tap the fan-shaped broadcast symbol to query the sensor units for the current alarm thresholds.
12. Tilt each Sensor Unit by hand and verify that the alarm sounds, then replace to its prior orientation to stop the alarm.

13. Once proper operation is confirmed, the Sensor Units are ready to be mounted (see Sensor Unit Mounting section below). Disconnect the power cable from the Sensor Units and install Sensor Units in the desired locations. Re-attach the power cable (if using external Battery Unit) or plug in the power dongle to activate the internal battery pack.

14. On the Control Center menu, verify communications with the appropriate Sensor Units. Tap the circular arrows to zero out the Sensor Units in their installed position.

15. The system is ready for monitoring. Note however that readings may fluctuate for the first few minutes as the sensors come to equilibrium. In normal operation, readings may fluctuate +/- 0.05 degrees. Larger fluctuations can occur due to normal movement of the structure, such as those associated with wind or temperature changes. These conditions may require increasing the Alarm Thresholds.

16. From the WBMS main menu tap View History to bring up a graphical presentation of sensor data. Note that the display does not update with data received after the History screen is opened. Tap the desired channels to display. Tap + then tap that portion of the screen of interest to zoom in. Multiple taps will zoom in to progressively smaller time windows. Tap – then tap the screen, multiple times if necessary, to zoom out. Tap the left arrow to return to the WBMS Menu.
17. Export History will write a file to the My Files folder. This file may be downloaded to a computer and imported into a spreadsheet program for further data processing or storage.

18. Clear History will delete all sensor data from the WBMS memory. This should be done at the start of a deployment or at the end, following downloading of all sensor data from the WBMS data folder. When reviewing the sensor data, a sensor data table contains screen shots of the device, zero points, and alarm thresholds.

19. Positive Sensor Directions provides graphics to indicate positive directions for each axis of the sensor.

20. Angular to Linear Chart provides a table of the relationship between angle and story drift in inches and percent, assuming a 12ft story height.

Exit shuts down the WBMS software and exits to the home screen of the device. Zero points and alarm thresholds remain stored in the Sensor Units. Received sensor data remains stored in the WBMS data folder. The program will continue to append data in the same data file. Thus, if the program freezes or crashes, the data will not be lost. The program will continue to append data in the same data file. Thus, if the program freezes or crashes, the data will not be lost.

21. Exit and restart will generally resolve the problem. If the problem persists, consult other system files, such as Excel and Word, to verify that the data is still present. If the problem persists, contact the user support specialist for further assistance.
WBMS Operation

Data from the sensors contained in the Sensor Unit is broadcast every five seconds under normal operation, and broadcast every second when a Sensor Unit is in an alarmed state. The alarm is triggered when either clinometer measures an angular change greater than the limit specified by the user. The allowable range for the alarm threshold is from 0.1 degrees to 60 degrees. The sensitivity of the clinometers is approximately 0.05° with a full-scale range of ±60 degrees.

The Sensor Units are color-coded and have a standard alphabetic designation that corresponds to the Sensor Unit color. This color corresponds to the Interface Unit screen where the angular data is displayed.

The following information is shown on the main screen of the Interface Unit:
- System ID number.
- Angle information for four Sensor Units.
- Sensor connection status.
- Sliding indicator that represents how close the current data is to the alarm condition.

Sensor Unit Mounting

The Sensor Units must be mounted on structural elements that will realize rotation in at least one of the monitored axes during an impending collapse. Mounting a Sensor Unit to structural elements that only translate during the early stages of a collapse will not provide enough advanced warning. It may be necessary to mount multiple Sensor units in the same region of the structure to insure the appropriate rotation is captured.

The Sensor Unit case must be firmly attached to a surface, in an upright position with the arrows on the sides of the Sensor Unit pointing up. A cargo strap, bungee cord, or other suitable strapping material can be used to securely attach the Sensor Unit to the structure. The units should not be mounted loosely to the structure because vibration or incidental contact could trip the alarms. If mounting to a structure where vibration is unavoidable, the alarm thresholds may have to have to be increased.
WBMS Android Interface Unit

For hands-free monitoring, connect the ear piece to the Android Interface Unit for continuous audio monitoring. Receipt of data from each sensor unit will be confirmed by a high-pitched ping every six seconds. A low-pitched ping indicates data communication failure. The alarm mode audio is unmistakable.

Battery life of the Android Interface Unit can be optimized by selecting appropriate options from the Settings, Display menu.:

1. Select Settings, Display.
2. Select Screen timeout and set to 15 or 30 seconds. The screen is re-displayed by pressing the power button.
3. Select Brightness and set to the lowest readable level.

WBMS Sensor Unit Operation

Each of sensor units contains a pair of inclinometers accurate to 0.05° over a range of +/-60 degrees that measure the angular change, in degrees, in two orthogonal planes. A 900 mHz radio transceiver broadcasts the sensor readings and accepts user commands. The sensor unit is powered either by 8 or 16 AA cell batteries (internal) or from an external 12V Battery Unit. Battery life with both internal battery packs fully charged is approximately 24 hours.

Installing WBMS Software

Download the latest version of WBMS-.apk (where # is the version number) from DisasterEngineer.org (must log-in as StS).

The file may be downloaded directly to the Android Unit or to a computer and transferred to the Android Unit via a USB connection.

1. To install software on the Android Interface Unit for the first time, select Applications, My files, WBMS.apk. Select OK.
2. To install updated versions of the software, it is necessary to first delete the current version. From the Applications screen tap Task Manager. On the Task Manager screen tap Downloaded then tap Uninstall for the WBMS program.

Proceed as above to install the latest version of the program.
LASER RANGE METER (Hilti PD32)

- Allows for accurate measurement of distances using emitted visible laser beam with measuring waves, which are reflected back to the range meter with a phase shift.
- The measuring range depends on the reflectivity and the surface structure of the target surface.
- Calculations of area and volume can be performed with multiple distance measurements, as well as the addition and subtraction of distances.
- Powered by 2-AA Alkaline batteries with a life of approx. 15,000 single measurements.

Laser Range Meter Operation – Direct Measurements

The normal maximum measurable distance is approximately 50 ft. Longer distances may be possible depending on the target reflectivity. A special target plate (Hilti PDA 50) is available to extend the maximum distance that can be measured to over 100 ft.

Distance measurements generally improve with darker lighting conditions. Shading the instrument from direct sunlight also increases the measuring range. Measurement ranges are reduced by very bright ambient light or when measuring through glass.

The Hilti PD32 has a magnified viewer that can be used to locate the laser dot on the target.

The display can be illuminated by pressing the illumination key located near the rear of the instrument. Shorter battery life can be expected with frequent use of the display illumination.
Laser Range Meter Operation – Direct Measurements (cont.)

1. Turn range meter on using the “On / Off” key located near the top right corner of instrument. The range meter is ready to use.

2. To take a single distance measurement, place the range meter measuring reference at desired location. Press the “Measuring” key (large circular key). Red laser dot will be active.

3. Position red laser dot on surface to which distance is to be measured.

4. Press the “Measuring” key again to take the distance measured.

Continuous measurements can be taken by pressing the “Measure” key for approximately 2 seconds. Distances are updated in the result line between 8 and 15 times a second, depending on the target reflectivity. A continuous measurement is indicated by a beeping when the beep signal is switched on. The continuous measuring process is stopped by pressing the “Measure” key. A range meter measuring reference is included by pressing the “Reference Point Shift” key located in the upper left-hand corner of the instrument. The measuring reference can be changed to the front edge of the instrument, or the rear edge of the instrument by pressing the “Reference Point Shift” key. A spike can be extended from the rear of the instrument for measuring from inaccessible corners. The additional distance of the spike is incorporated into the measured distance.

The screen will display up to four successive measurements with the last measurement taken displayed at the bottom of the screen.
Two distance measurements can be added together by pressing the “+” key (located to the right of the “Measure” key) between the first and second measurements.

Two distance measurements can be subtracted from each other by pressing the “-” key. Pressing either the “+” or “-” activates the red laser dot for the second measurement.

Area or Volume measurements are taken by first pressing either the “Area Function” or “Volume Function” keys to the left of the “Measure” key.

The “Measure” key is then pressed once for each measure. The area or volume is given in the display line with individual distance measurements displayed above.

**Operation – Indirect Measurements (Triangle Method)**

Distances can be measured indirectly by recording distances to either end of the distance to be determined. This is useful for measuring distances that cannot be done so directly, such as building heights. The PD-32 uses the Pythagoras’s theorem to calculate the distance. Either two (simple version) or three (combined version) distances are recorded. For the simple version, the second recorded distance must be perpendicular to the distance to be determined. If this is not possible, then the combined version can be used with the middle recorded distance perpendicular to the distance to be determined. The angle between recorded distances must be greater than 10 degrees to avoid unreliable calculations. If not, a double beep indicates an error and the PD-32 terminates the operation.

1. Press the “Indirect Measurement” key. This activates the combined version. Pressing the key again will active the simple version. (Either a combined or single triangle symbol will be shown in the display.)

2. Aim the PD-32 at one end of the line to be determined and press the “Measure” key.
Laser Range Meter Operation

Indirect Measurements (Triangle Method) (continued)

3. Aim the PD-32 to measure the perpendicular distance. The continuous measurement mode can be performed by measuring a

Calibration

...to be used for an extended period of time.

Settings

Several instrument settings can be changed in the setting menu, which is accessed by pressing the "on/off" key for approximately 2 seconds. The setting menu is terminated by pressing the "on/off" key again.

Maintenance

Remove the range meter from its case if it becomes wet. Clean the range meter, carrying case, and accessories. Repack the equipment only after it is completely dry.

Check the accuracy of the equipment if it is used after a long period of storage or transportation.

Batteries should be removed from the range meter if it is not going to be used for an extended period of time.

Calibration

The calibration of the instrument can be performed by measuring a distance of known length approximately 3 to 15 ft in length, 5 times. The mean of the deviations of the known distance should be within 0.05 ft. The deviation of the mean of the deviations is to be determined. If the deviation is greater than 0.05 ft, the range meter should be recalibrated.

5-62
NEW LASER RANGE METER (Leica Disto D5)

This device has most of the features of the Hilti PD-32, but also has a 2.4" color display with 4x zoom that allows the user to more easily see the target and position the laser at distance, and in daylight. It has accuracy of 2 inches in up to 600 feet.

Functions are similar to the Hilti PD-32. Special features are:

- Digital, 2.4" Color Viewfinder with 4 times zoom.
- Built-in Tilt Sensor that determines tilts up to 45 degrees.
- Function Keys for as shown below:

1. On/Measuring button
2. Digital point-finder
3. Timer button
4. Plus button
5. Minus button
6. Area/volume button
7. Indirect Measurements
8. Trapezoid button
9. Functions button
10. Reference button
11. Storage/memory button
12. Clear/Off button
13. Menu/Equal button
ELECTRONIC METAL LOCATOR (Zircon MT 6)

Locates metallic objects, such as reinforcing steel, embedded in concrete, as well as other metallic objects, such as copper pipe, locations metallic objects, such as rebar, ribbed and unribbed embeded in wood.
The type of metal detected will be indicated by the magnetic/nonmagnetic icon.
Once a target has been located, reposition the unit over it and scan perpendicular to the original scanning direction.
Continue scanning to determine if there are multiple targets.
If precise depth is important, recalibrate as outlined in following section.
Turn off the unit by moving the mode switch to the OFF position.

**Calibration**
The MT 6 automatically calibrates when turned on. However, the depth sensitivity of the MT 6 can be increased by recalibrating in an area free of metal, through the same medium. To recalibrate:
1. Locate an area that is on the surface where there is no indication of metal.
2. Press and release the “Press to Calibrate” switch. All icons on the display will light momentarily during calibration.
3. Rescan target areas. A more sensitive depth reading should now be obtained.

**Battery Installation/Replacement**
1. Slide-open the battery compartment located at the lower front portion of the unit.
2. Connect a 9-volt battery into the battery clip. (lasts about 1-yr)
3. Insert battery into the battery compartment and replace door.

**Additional Notes**
- The depth readings of the MT 6 are calibrated for a #4 size rebar (magnetic) and a ½ inch copper pipe (nonmagnetic).
- If scanning surface is relatively rough, a thin piece of cardboard can be placed between the unit and surface. Cardboard thickness must be subtracted from the depth reading.
- An auto power off feature turns off the MT 6 after five minutes of inactivity. After it turns off, the unit loses its calibration.
DIGITAL ELECTRONIC LEVEL (SmartLevel & SmartTool)

Two digital electronic levels are available in the US&R cache (SmartLevel® and SmartTool™) that determine and display levelness electronically. Both levels display angle measurements in degrees, slope (%), and pitch (in./ft.). The SmartLevel also displays a simulated bubble. The operation and functions of both levels are similar. The operation and functions of both levels are similar.

Operation

1. Ensure battery is correctly installed and has sufficient voltage.
2. Push and hold the (SmartLevel) button (SmartLevel) or the (SmartTool) button (SmartTool) for 2 seconds.
3. CAL 1 will appear briefly on the display.
4. Push and hold the (SmartLevel) button (SmartLevel) or the (SmartTool) button (SmartTool) for 2 seconds.
5. Place level on a flat horizontal surface (surface does not need to be level), wait 10 seconds.
6. Push and hold the (Calibrate) button (SmartTool).
7. CAL 1 will appear briefly on the display.
8. Turn on level by pressing the (ON/OFF) button. CAL 2 will appear briefly on the display.
9. Push and hold the (Calibrate) button (SmartLevel) or the (SmartTool) button (SmartTool) for 2 seconds.
10. Pull out the level and re-run until 10 seconds.
11. If level is to be used as a continuous monitoring device, the battery saver must be deactivated (battery life is approx. 1 week). Also, ensure battery is correctly installed and has sufficient voltage.

Calibration – Level

1. Place level on a flat horizontal surface (surface does not need to be level), wait 10 seconds.
2. Push and hold the (Calibrate) button (SmartLevel or Smarttool) for 2 seconds.
3. Select the level display mode (degrees, %, or IN/FT).
4. Push and hold the (Calibrate) button (SmartLevel or SmartTool) for 2 seconds.
DIGITAL ELECTRONIC LEVEL (SmartLevel & SmartTool) (continued)

Calibration – Plumb
1. Place level on a flat vertical surface (surface does not need to be plumb), wait 10 seconds.
2. Push and hold the Calibrate (RESET) button for 2 seconds. CAL1 will appear briefly on the display.
3. Rotate the level edge-for-edge so that the same end of the level is pointing down, wait 10 seconds.
4. Push and hold the Calibrate (RESET) button. CAL2 will appear briefly on the display. Calibration is complete.

Calibration – To Zero Reading
The digital electronic levels can be calibrated to provide a zero reference reading on non-level or non-plumb surfaces. This is useful when monitoring components for changes in level or plumbness. To zero the reading, first secure the level on the surface to be monitored. Follow the calibrations procedures listed above, except, do not rotate level between the two calibrations. This tricks the level into thinking it is averaging two different readings.

NOTES

____________________________________________________________________
INTRODUCTION to SECTION 6

This section contains information on various subjects that could become needed References at a Disaster Site.

The References are arranged as follows:

- Rapid Structure Triage Page 6-2
- Sample Calculations of Shoring 6-7
- US&R Site Mapping Symbols 6-15
- Critical Incident Stress Information 6-19
- Rope, Knot, and, Harness Refresher 6-26
- Design Loads for Pickets 6-31
- Crane Hand and Voice Signals 6-33
- Excavator Hand Signals 6-35

TYPICAL FIRST DAY’S DEPLOYMENT

Immediately following deployment, (depending on incident specific conditions), the following tasks may need to be performed:

- Rapid Structure Triage, I.D. and Rating of Structures
- Search – Detection and Location
- Structure Hazard Evaluation and Marking
- Search and Victim Marking
- Develop Structure Hazard Mitigation List and Priorities

TYPICAL 1ST HOURS DEPLOYMENT

Four or more Buildings
Pre-prioritization of structures using Rapid Structure Triage
(1 or 2 RST Teams, including: StS, HMS, TIS & others, quickly followed by Search Teams)
Rapid Structure Triage (RST) refers to the process of very quickly evaluating several collapsed structures and determining which structures will receive operational priority. This process will be most appropriate for disasters that occur suddenly and cause collapse of many structures.

Although the RST process is intended to be flexible and incident dependent, teams are most likely to be staffed as follows:

- **RST Team(s)** - would provide initial victim detection and ground assessment.
- **Search Location Team(s)** - would locate victims, assess their condition and plan rescue. They would also mark the structure with appropriate Search and Structure Hazard Marks.
- **Search Detection Team(s)** - would provide detailed hazard assessment and mark the structure, based on live finds. They would also provide feedback to the search and structural hazard assessment team.
- **Search Location and Detection functions may be combined in one or more Search teams.**
- **Team Tasks**
  - Similar to detection Team.
  - Search Team - STM, canine search spec, Recue Spec. Tech
  - Technical Information Specialist (TIS).
  - Team Manager (TMM), Hazmat Specialist (HMS), and/or Rescue Team Manager (SMR).

Rapid Structure Triage (RST) refers to the process of very quickly evaluating several collapsed structures and determining which structures will receive operational priority.
RST SCORING CRITERIA:

- The following will be evaluated in assessing the Probability of having Viable Victims:
  - Potential number trapped - low  medium  high
  - Victim access effort - difficult  medium  high
  - Type of voids - compact  separated  open

- The following will be evaluated in Assessing Risk:
  - Chance of further collapse - low  medium  high
  - Number of Falling Hazards - low  medium  high
  - Void support condition - good  poor  unknown

The selection of the applicable level of relative risk requires that the Structures Specialist uses his/her best judgment. The Rescue Team Mgr should be consultation in selecting from the victim probability criteria. All on the RST Team, including the StS must be prepared to quickly make these decisions.

RST STRUCTURE RATINGS:

Each structure would be given a two letter Rating to indicate the probability of being able to rescue viable victims, and a two letter Rating for Assessment of Risk.

These Ratings would be based on the Scoring Criteria presented above, and require "Expert Judgment" to be applied by the StS, HMS, and other members of the RST Team.

- For probability of being able to rescue viable victims:
  - LP indicates Low Probability
  - MP indicates Medium Probability
  - XP indicates High Probability (to be consistent with XR)

- For Assessment of Risk
  - LR indicates Low Risk
  - MR indicates Medium Risk
  - XR indicates High Risk (HR is used for Human Remains)
There are several factors which will influence the RST process:

- Occupancy
- Time of Day (at times some buildings are unoccupied)
- Disaster Type & Structural Condition
- Pre-Disaster Intelligence & Resources Available
- Collapse Type & Structural Condition
- Number of Trapped Victims
- Building Area or Building Occupancy
- There are several factors which will influence the RST process:

There are some conditions that would indicate a NO GO for US&R operations: (better term would be SLO-GO since that would indicate after the extreme hazards have been mitigated, the building might be searched.)

There are 2 methods for calculating the potential number of trapped victims: Building Area or Building Occupancy:

### Building Area

- **Public Assembly**: 1 per 25 sq ft
- **Schools**: 1 per 70 sq ft
- **Hospitals**: 1 per 100 sq ft
- **Commercial**: 1 per 100 sq ft
- **Office/Gov't**: 1 per 150 sq ft
- **Public Safety**: 1 per 150 sq ft
- **Multi-Residential**: 1 per 200 sq ft
- **Industrial**: 1 per 200 sq ft
- **Warehouse**: 1 per 600 sq ft

### Occupancy

- **Schools**: 20-30 per Classroom
- **Hospitals**: 1.5 per Bed
- **Residential**: 2.0 per Bedroom
- **Commercial**: 1 per 100 sq ft
- **Office/Gov't**: 1 per 70 sq ft
- **Public Safety**: 1 per 25 sq ft
- **Public Assembly**: 1 per 25 sq ft
HOW RST RATINGS ARE APPLIED:

- After assessing each of the three Criteria for Victim Probability, each structure would be given a Rating of LP, MP, or XP.

- After assessing each of the three Criteria for Risk, each structure would be given a Rating of LR, MR, or XR

  - This process required the StS & HMS to make rapid, value judgments in a very short time.

  - Victim probability should include considerations such as potential numbers and ease/difficulty/risks involved with their extrication.

  - It should be understood that it is possible to have more than one structure with the same rating.

RST FORMS:

RST Forms were developed, and they are shown in Sect 9.

**RST -1** - allows space for a crude location map of the assigned structures (or at least the first group that are being evaluated). It also has three sections for recording the data from three structures.

**RST - 2** has three additional three sections for recording the data from three structures, plus instructions for filling-out the forms and a guide for determining collapse risk. It is shown in Sect 9.

EXAMPLES OF RISK LEVEL:

- **Low Risk** – would include Pancaked Concrete Slabs, Soft 1st Story Collapse, and Wood 1 & 2-story Structures.

- **Medium Risk** – would include Partly Collapsed Concrete Bldgs, Racked 3 & 4-story Wood Bldgs, Free-standing URM/Concrete -Plumb Walls, and URM Structures w/ Lean-to, V, & Wall Fall Collapses.

- **High Risk** – partly collapsed Precast or PT Concrete Bldgs, Un-collapsed and leaning Structures, Free-standing URM/Concrete –Leaning Walls, Structures w/ many Falling Hazards.

SAMPLE STRUCTURAL CALCULATIONS of
EMERGENCY SHORING

MATERIAL PROPERTIES USED IN CALCULATIONS

Concrete Properties
Weight = 150 pcf \( F_{c'} = 3000 \text{ psi (28-Day Strength)} \)

Wood Allow Stress Design Properties – D. Fir & So. Pine

One may increase these values by 25% for US&R Shores

See Section 5 (FAQ) for Strength of other Wood Species

Mod. of Elasticity \( = E \) = 1,400 to 1,600 ksi

Bending Stress \( = F_b \) = 1500 psi for 4x and 1200 psi for 6x

(Sect. Modulus \( = S \) = BD\(^2/6\), Mom. of Inertia \( = I \) = BD\(^3/12\))

Horiz. Shear Stress \( = F_v \) = 95 psi for 4x and 85 psi for 6x

(F\(_v\) has been increased by about 100% in the 2001 NDS)

Compression Parallel to Grain \( = F_{cP} \) = 1100 psi

Compression Perpendicular to Grain \( = F_{c\perp} \) = 625 psi

Buckling Strength \( = F_a \) = 480,000 psi \( / (L/D)^2 \)

L/D = 25 max. (to see crushed cross-grain before buckling)

L/D = 50 max. (but failure may be by sudden buckling)

INDEX of SHORING CALCULATIONS

CRITICAL INCIDENT STRESS - 1

CRITICAL INCIDENT STRESS (CIS) results from a crisis event, so overwhelming to the individual that it is likely to cause short or long term malfunctioning.

GENERAL:

1. The effects of CIS impair functioning on-scene and may continue to emerge upon demobilization or thereafter.
2. Self monitoring and management of CIS is critical for both short and long term personal well being and team performance.
3. As a Structures Specialist, you will be working in an environment that is difficult (at best) that may produce CIS reactions because of the following factors:
   a. Exposure to extreme stimulus involving death, mutilation, destruction, and threat under arduous conditions.
   b. Pressure to make consequential decisions under aggravated conditions of uncertainty, fatigue, and duress.
   c. Role conflict, competing demands, shifting command and assignments, and an changing scope of work.

ALERT:

1. If after self examination you feel unready to proceed with the assignment, do not accept it. It is better to remain fit for future assignments than to become impaired from this.
2. Following factors can create special vulnerability to CIS:
   Prior Trauma
   Background Stress
   Family Disruption/Discord
   Physical Fatigue
   Psychological Need
   Recent Changes/Loss
   Feelings of Inadequacy
   Overly Optimistic or Pessimistic Beliefs
CRITICAL INCIDENT STRESS RECOGNITION:

On-scene CIS is termed ACUTE STRESS RESPONSE (ASR).

ASR at the disaster scene can manifest itself in altered thought process, emotions, physical symptoms, and behavior. ASR may manifest in yourself or others. The signs of ASR can include various combinations of the symptoms listed below:

COGNITIVE:
- Confusion
- Memory Loss
- Can't Recall Words
- Time Distortion
- Difficulties with Problem Solving
- Trouble Prioritizing
- Trouble Focusing
- Can't Recall Words
- Memory Loss
- Confusion

EMOTIONAL:
- Fear
- Anger
- Anxiety
- Numb
- Anguish
- Anger
- Anguish
- Numb
- Fear
- Intense Frustration
- "Inappropriate" Feelings
- "Overwhelmed"
- Irritable
- Frustration
- Other Signs of Shock

PHYSICAL:
- Headaches
- Heart Palpitations
- Muffled Hearing
- Nausea
- Cramps
- Profuse Sweating
- Rapid Breathing
- Fainting
- Other Signs of Shock

Other Signs of Shock:
- Fainting
- Rapid Breathing
- Flushed, Sweating
- Confused
- Nausea
- Heated, Haggard
- Head Pulsations
- Headaches
- Other Signs of Shock

RECOGNITION:

Various combinations of the symptoms listed below may manifest in yourself or others. The signs of ASR can include process, emotions, physical symptoms, and behavior. ASR may manifest at the disaster scene.
US&R STRUCTURES SPECIALIST FOG
GENERAL REFERENCE

CRITICAL INCIDENT STRESS - 3

ASR normally consists of some combination of these symptoms into one of two general categories: AGITATED or DEPRESSED. Look for the following:

AGITATED (25% of ASR Cases):
- **Appearance**: Flushed, sweating, agitated
- **Mood**: Panicked, enraged, hysterical
- **Behavior**: Rapid, frenzied, ineffectual, uncontrolled

DEPRESSED (75% of ASR Cases):
- **Appearance**: Pale, submissive, shock-like
- **Mood**: Blunted, numb, emotionally unresponsive
- **Behavior**: Slowed, automatic, paralyzed, immobilized

SELF MANAGEMENT:

Remember and resist your tendency to ignore your own needs. If you are not functioning fully, you will be a danger to others on-scene, to yourself, and later on to your family.

If you are experiencing some of the signs of ASR:
- Let your partner and supervisor know about it.
- Act on your own behalf:
  - Take an extended break away from the disaster scene.
  - Take fluids and nourishment (cut down caffeine and sugar - increase carbohydrates).
  - Discuss your experiences and reactions with others.
  - Listen to the advice of trusted others.
  - Do not resume duties until you are reoriented and re-stabilized.
  - Ask for and accept support services, such as on-scene consultation or debriefing ASAP.
If you observe others (partners, colleagues, or supervisors) exhibiting ASR signs:

Convey your observations and concerns to that person.
Advise that person to follow the general protocols for self-management.

If person is AGITATED:
- Use firm, calm directions to gain attention and provide direction.
- When providing feedback regarding your concerns, focus on behavior rather than the person.
- Provide simple but relevant and useful tasks.

If person is DEPRESSED:
- Have individual sit or lie down.
- Provide simple but relevant and useful tasks.
- Do not overload with information or negative content.

ON-SCENE CIS SERVICES:
- Get medical assistance.
- Screen for shock.
- Do not overlook critical information or negative content.
- Be supportive and check for comprehension.
- If person is depresses:
  - Get medical assistance.
  - Provide simple but relevant and useful tasks.
  - Do not overload with information or negative content.

ON-SCENE CIS SERVICES:
- When providing feedback regarding your concerns, focus on behavior rather than the person.
- Use firm, calm directions to gain attention and provide direction.
- Convey your observations and concerns to that person.

GENERAL REFERENCE
USER STRUCTURES SPECIALIST FOCS

6-22
CRITICAL INCIDENT STRESS - 5

HOME STATION (POST DEPLOYMENT):

Delayed stress reactions are possible in the days, weeks, or months following your return from the disaster.

SELF-MONITORING:

Self-monitoring is just as important after returning home as it is during US&R operations. You should monitor yourself for any of the following reactions:

- Flashbacks
- Nightmares
- Problems at Home
- Problems at Work
- Depression
- Anxiety
- Guilt
- Fears
- Isolation
- Difficulty Relating to Others
- Problems with Self-Control
- Disproportionate Emotionality
- Obsessive Thoughts About Incident
- Psychosomatic Illness
- Precipitous Life Changes
- Unhappiness/Dissatisfaction

These reactions, if moderate, are fairly normal and transient. If they last more than four to six months, however, or are negatively effecting your personal or work life, you should get help in working through those thoughts, feelings or attitudes engendered by the disaster experience.
It is suggested that you make 3 visits with your home station CIS provider after returning home. The schedule of suggested visits is as follows: (R = return date):

- R + 3-5 Days
- R + 2 Weeks
- R + 2 Months
- R + 3-5 Days

Take full advantage of these opportunities to discuss your feelings and reactions. You can also bring them by withdrawing into yourself and shutting them out. You can hurt them by your unexpressed anger and sadness.

If your CIS provider or your family suggests meeting together, take the request seriously. Even if you do not see the need yourself, they may see something that you don't. They are worth the effort. The last people you want to hurt are your family members and loved ones. You can hurt them by your unexpressed anger and sadness.

CIS guidelines have been given material to assist your family and supervisors. These can include reactions encountered privately and reactions that can include reactions encountered publicly. These guidelines have been given limited to your local CIS provider. In addition, they have been given guidelines to assist your family and loved ones. You can hurt them by your unexpressed anger and sadness.

Full advantage of these opportunities to discuss your feelings and reactions. You can also bring them by withdrawing into yourself and shutting them out.
HAZMAT FIRST RESPONDER AWARENESS

Structures Specialists should carry their Department of Transportation's Emergency Response Guidebook (DOT P 5800.5) during deployment.

As a Structures Specialist conducting an initial evaluation of an incident, you may be the first to encounter or discover a HAZMAT condition.

When surveying the incident, be aware of potential HAZMAT indicators:

- Unusual colors/odors
- People running from scene
- Evidence of Leak
- Unusual noise in fittings/valves
- Container Shapes
- Placards or Signs
- Occupancy/Location

Upon discovery or suspicion of a HAZMAT situation your mission is as follows:

**SAFETY** of yourself and team members.

**ISOLATE & DENY ENTRY.**

**NOTIFICATION** of Team HAZMAT specialist or local authorities.

**THINK SAFETY AT ALL TIMES.**

MODIFIED TRUCKER'S HITCH

Attach the end of the Modified Trucker's Hitch Line to the Anchor Prusik with a Carabiner, and adjust tension as required by sliding the Prusik Hitch up and down.
OSHA requires that Commercially Manufactured Harness be used, except in extreme emergencies.

The Structures Specialist would normally be placed in a Class 3 Harness (as shown below) if they needed to be raised or lowered in order to view an important component of a damaged structure.
DESIGN LOAD OF PICKETS (PINS) IN SOILS

The following pickets have been tested during StS2 Training since 2004. These tests were performed in relatively firm cohesive soil.
- 40 - 1" dia x 48" plain bar driven 36" to 42" into ground
- 8 - 1" dia x 48" rebar driven 36" into ground
- 8 - 1" dia x 36" rebar driven 24" to 30" into ground
- 13 - 5/8 x 36" screed pins driven 24" to 30" into ground

Based on these tests the **Recommended Design Lateral Load Capacity for these Pickets in Firm Cohesive Soils** is as follows:

1. 750 lb for 1" dia x 36" (min) plain bar or rebar driven 24" (min) into ground.
2. 375 lb for 5/8 x 36" screed pins driven 24" (min) into ground.

The table below is based on July 1984, FHWA-IP-84-11, Handbook, Design of Piles & Drilled Shafts Under Lateral Load. **Pin Design Load is based on approx 50% of Capacity**

</tbody>
</table>
Multi-picket layouts should provide capacity that is greater than a single picket. However, the capacity of a pair of pickets will be less than that of a single picket times the total number of pickets.

Starting in 2010, pairs of pickets were tested during STS2 training. The tests were performed as follows:

1. 1" diameter x 36" and 48" steel pickets were driven at angles of zero and 20 degrees off the vertical, and about 12" was left exposed above ground.
2. A double wrap of 1" nylon webbing was placed from the top of the front picket to the ground level of the rear picket.
3. The test load was applied at the ground level of the front picket.
4. Parts of pickets were driven at angles of zero and 20 degrees off the vertical, and about 12" was left exposed above ground.
5. The tests were performed as follows:

Based on these tests:

A design load of 1200 lbs is recommended for a pair of 1" diameter steel pickets driven 30" min. into firm cohesive soil, spaced 3 feet apart, and tied together with a double wrap of 1" nylon webbing.

Rope Anchors Using Pickets

Retract boom
Crane Voice Signals

The NCCCO Voice Signals must contain the following 3 elements:

- Function and direction.
- Distance and/or speed.
- Function stop.

Acceptable voice signal functions are:

- Hoist, or Raise the load
- Lower load
- Slow, 25ft, 10ft, 5ft, 2ft, 1ft, lower stop
- Swing right, 25ft, 10ft, 5ft, 2ft, swing stop
- Use main hoist, use whip line / auxiliary hoist
- Swing right, swing left
- Stop

Voice Crane Signal Examples:

- Swing right 50ft, 25ft, 10ft, 5ft, 2ft, swing stop
- Lower load 100ft, 50ft, 25ft, 10ft, 5ft, lower stop
- Use main hoist, use whip line / auxiliary hoist

Voice signals are normally transmitted by hand-held radio or

voice phone, and must be clear and loud in order to be heard over the

noise of the machinery.

Voice signals are normally transmitted by hand-held radio or
telephone, and must be clear and loud in order to be heard over the

noise of the machinery.

Voice signals are normally transmitted by hand-held radio or
telephone, and must be clear and loud in order to be heard over the

noise of the machinery.

The radio or telephone devices and communication must be

clearly understood with normal operational noise.

Voice signals are normally transmitted by hand-held radio or
telephone, and must be clear and loud in order to be heard over the

noise of the machinery.

Voice signals are normally transmitted by hand-held radio or
telephone, and must be clear and loud in order to be heard over the

noise of the machinery.

Voice signals are normally transmitted by hand-held radio or
telephone, and must be clear and loud in order to be heard over the

noise of the machinery.

Voice signals are normally transmitted by hand-held radio or
telephone, and must be clear and loud in order to be heard over the

noise of the machinery.

Voice signals are normally transmitted by hand-held radio or
telephone, and must be clear and loud in order to be heard over the

noise of the machinery.

Voice signals are normally transmitted by hand-held radio or
telephone, and must be clear and loud in order to be heard over the

noise of the machinery.

Voice signals are normally transmitted by hand-held radio or
telephone, and must be clear and loud in order to be heard over the

noise of the machinery.

Voice signals are normally transmitted by hand-held radio or
telephone, and must be clear and loud in order to be heard over the

noise of the machinery.

Voice signals are normally transmitted by hand-held radio or
telephone, and must be clear and loud in order to be heard over the

noise of the machinery.

Voice signals are normally transmitted by hand-held radio or
telephone, and must be clear and loud in order to be heard over the

noise of the machinery.

Voice signals are normally transmitted by hand-held radio or
telephone, and must be clear and loud in order to be heard over the

noise of the machinery.

Voice signals are normally transmitted by hand-held radio or
telephone, and must be clear and loud in order to be heard over the

noise of the machinery.

Voice signals are normally transmitted by hand-held radio or
telephone, and must be clear and loud in order to be heard over the

noise of the machinery.

Voice signals are normally transmitted by hand-held radio or
telephone, and must be clear and loud in order to be heard over the

noise of the machinery.

Voice signals are normally transmitted by hand-held radio or
telephone, and must be clear and loud in order to be heard over the

noise of the machinery.

Voice signals are normally transmitted by hand-held radio or
telephone, and must be clear and loud in order to be heard over the

noise of the machinery.

Voice signals are normally transmitted by hand-held radio or
telephone, and must be clear and loud in order to be heard over the

noise of the machinery.

Voice signals are normally transmitted by hand-held radio or
telephone, and must be clear and loud in order to be heard over the

noise of the machinery.

Voice signals are normally transmitted by hand-held radio or
telephone, and must be clear and loud in order to be heard over the

noise of the machinery.

Voice signals are normally transmitted by hand-held radio or
telephone, and must be clear and loud in order to be heard over the

noise of the machinery.

Voice signals are normally transmitted by hand-held radio or
telephone, and must be clear and loud in order to be heard over the

noise of the machinery.

Voice signals are normally transmitted by hand-held radio or
telephone, and must be clear and loud in order to be heard over the

noise of the machinery.

NOTES:

1. Ref. wind speed measured at height of 30 feet above grade.
2. Basic stagnation pressure, \( P = 0.00256V^2 \), where \( V \) is in mph & \( P \) is in psf. (10psf recommended for design in most situations, but may use 5psf if building is more slender.
3. Pressure coeff. based on exposure B for urban environment.
4. Pressures include gust factor & shape coefficient of 1.3.
5. Pressure acting on net area normal to wind.
6. For open frame towers built with members of angular cross-section multiply table values by 3 and apply to total normal projected area.
7. For open frame towers built with members of circular cross-section multiply table values by 2 and apply to total normal projected area.

**WIND PRESSURES ON BUILDINGS, PSF**
INTRODUCTION TO USEFUL TABLES - TIMBER DESIGN

Following this page there are tables that provide:

- Allowable (Design) Loads for Plywood
- Allowable (Design) Loads in Bolts and Lag Screws
- Allowable (Design) Loads in Nails & Screws

This information is provided for Douglas Fir, Southern Pine, Hem-Fir Group and Spruce-Pine-Fir Species.

The Tables have been reproduced from “National Design Specifications for Wood Construction, 1991 Edition”.

DESIGN LOAD STRESSES – No. 1 Douglas Fir

One may increase these values by 25% for US&R Shores
(On page 7-12, note that a 60% increase is recommended when using nails that resist transient loading – Raker Shores)

Mod. of Elasticity  = E  = 1,400 to 1,600 ksi

Bending Stress    =  Fb = 1500 psi for 4x & 1200 psi for 6x
(Sect. Modulus     = S  = BD^2/6, Mom. of Inertia = I = BD^3/12)

Horiz. Shear Stress = Fv = 95 psi for 4x & 85 psi for 6x
(Fv has been increased by about 100% in the 2001 NDS)

Compression Parallel to Grain  = Fc       = 1100 psi
Compression Perpendicular to Grain = Fc⊥ = 625 psi

Buckling Strength  = Fa = 480,000 psi / (L/D)^2
L/D = 25 max. (to see crushed cross-grain before buckling)
L/D = 50 max. (but failure may be by sudden buckling)

Note that Design Load Stresses for Southern Pine & Hem-Fir Group are 85% of those listed above, and Spruce-Pine-Fir Species are 75% of those listed above.
DESIGN DEAD LOADS for COMMON MATERIALS

Normal Reinforced Concrete = 150 pcf
(12" conc slab weighs 150 psf, 6" slab weighs 75 psf, etc)

Heavily Reinf. Conc Beams & Cols = 160 to 180 pcf

Structural Steel = 490 pcf = 40 psf for 1" thick steel plate

Aluminum = 165 pcf = 14 psf for 1" thick aluminum plate

Wood Floors weigh 10 psf to 25 psf (25 with 1.5" conc fill)

Normal Home or office furniture = 10 to 15 psf per floor

Concrete Masonry Rubble = 10 psf

Concrete Hollow Conc Masonry = 40 psf

8" Hollow Conc Masonry = 60 psf

8" Hollow Pncr. Plank = 80 psf

Frame wall w/ 7/8" Gyp ea. Side = 7 psf

Frame wall w/ 1/2" Gyp ea. Side = 2.5 psf

2/5 Gypsum Board = 2.5 psf

3/4" Wood Flooring = 3 psf

Wood Joist @ 16" oc. = 2.5 psf

Dry wood = 35 psf

Masonry and Cement Plaster = 95 psf

Aluminum = 165 psf = 14 psf for 1" thick aluminum plate

Structural Steel = 490 psf = 40 psf for 1" thick steel plate

Heavily Reinf. Conc Beams & Cols = 160 to 180 psf

Normal Reinforced Concrete = 150 psf

(Repeated from page 1-30)

RESCUE LIVE LOADS

Concrete Floors weigh from 80 to 150 psf

Steel Floors weigh from metal deck & conc fill weigh 50 to 70 psf

Wood Floors weigh 10 psf to 25 psf (25 with 1.5" conc fill)

In interior wood & metal stud walls = 10 psf per inch of thickness

Normal Reinforced Concrete = 490 pcf

(Repeated from page 1-30)

US&R STRUCTURES SPECIALIST FOG

USEFUL TABLES

<tr>
<td>48oc (1.125)</td>
<td>1333</td>
</tr>
</tbody>
</table>

**Notes:**
1. Table from APA Nov 2001. Normal load duration, dry conditions, 2” nom. wide supports (min.). Bending governs. Duration factors may be used.
2. For **APA Rated** Sheathing: 24/16 style rating, 24 = roof rating with L/180 deflection and 16 = floor rating with L/360 deflection. For **Sturd-I-Floor**: 16oc style rating, floor span rated with L/360 deflection.
3. Order “Rated” panels by “Span Rating” (stamped on the plywood) not thickness. Can be plywood or OSB.
4. Face grain perpend. to span. Block all edges, unless T&G or separate wearing surface. Reduce bending strength by up to a factor of 5 for face grain parallel.
## Plywood Floors Supporting Fork-Lift Truck Traffic

(taken from APA Pub. Plywood Floors for Lift Truck Traffic)

<table>
<thead>
<tr>
<th>Plywood Type</th>
<th>Maximum Recommended Loads</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>2 Layers 5/8&quot; Struct 1, C-D, joints staggered 2 ft, unglued</td>

</tr>
<tr>
<td>2 Layers 3/4&quot; Group 1, A-C, joints staggered 2 ft, unglued</td>
<td>2300</td>
<td>2. Wheel loads used on frame were 2&quot; long by the width of the tie.</td>
</tr>
<tr>
<td>2 Layers 7/8&quot; Struct 1, A-A, glued</td>
<td>4550</td>
<td>3. Only solid rubber or pneumatic tires should be used on plywood supports. (No Steel Wheels).</td>
</tr>
<tr>
<td>2 Layers 1-1/8&quot; Struc 1, A-A, glued</td>
<td>5850</td>
<td>4. Plywood supporting floor rises with a larger bearing area will have a significant increase in performance.</td>
</tr>
<tr>
<td>2 Layers 1-1/8&quot; Struc 1, A-A, glued</td>
<td>2300</td>
<td>5. Plywood is a porous material with a significant increase in performance.</td>
</tr>
<tr>
<td>Note: Values given are 65% of the tested first distress.</td>
<td></td>
<td>7. Plywood is a porous material with a significant increase in performance.</td>
</tr>
<tr>
<td>12&quot; Spans, 2-5/8&quot; (min) Wide Supports (for Rolling Viable Loads) – Pounds</td>
<td></td>
<td>8. Plywood can support only 70% of the weight with 4&quot; wide ties. The reduction is linear with the tie width.</td>
</tr>
</tbody>
</table>

### Notes:
- Plywood can support only 70% of the tested first distress.
- Wheel loads used on this were 2" long by the width of the tie.
- Only solid rubber or pneumatic tires should be used on plywood supports. (No Steel Wheels).
- Plywood supporting floor rises with a larger bearing area will have a significant increase in performance.
- Values given are 65% of the tested first distress.

</tr>
<tr>
<td></td>
<td>3 ½″</td>
<td>0.162</td>
<td>225</td>
</tr>
</tbody>
</table>

*Values include 60% increase for Emergency Shoring 1.*

- Min. Penetration & Spacing is ½ of the Nail Length
- The 60% increase is justified for the Raker Cleat nailing.

**LAG SCREW WITHDRAWAL VALUES**

In pounds per inch of threaded penetration

<td>576</td>
<td>475</td>
</tr>
<tr>
<td>1</td>
<td>734</td>
<td>642</td>
<td>516</td>
</tr>
</tbody>
</table>

*Values include 60% increase for Emergency Shoring 1.*

1. Nailing is not used to transfer direct loads in any other type of emergency shoring.
2. Due to the transient nature of their maximum loading.
3. The 60% increase is justified for the Raker Cleat nailing.

**WORKING LOAD VALUES FOR WOOD CONNECTORS**
INTRODUCTION TO USEFUL TABLES - STEEL DESIGN

Following this page there are tables used in steel design:

- Allowable Stress for 50ksi Columns
- Dimensions and properties for Steel Tubes
- Dimensions and properties for Steel Pipes
- Allowable Loads for Steel bolts

The Tables have been reproduced from “Manual of Steel Construction – ASD, 9th Edition”

USEFUL INFORMATION – A36 STEEL DESIGN GUIDE

Mod. of Elasticity = E = 29,000 ksi

Bending Stress = F_b = 22 ksi
(Assumes lateral bracing is spaced 16 x width, max.)

(Sect. Modulus of W sect = S = 0.1 x wt. per ft. x depth )
(Moment of Inertia = I = S x d/2)

Shear Stress = F_v = 14 KSI

Radius of Gyration – X direction = r_x = (I/A) ^{1/2}

Radius of Gyration – Y direction of W sect = Flange Width/4

Strength of E60 Weld = F_{weld} = 1kip/in. per 1/16" thickness

Wt. of Steel Sections per ft = 3.4 lbs x Area of cross-section
(See Pg 1-30 for Quick Weight Estimating (per sq ft) Method)

The following information is intended as a Quick Field Design Guide for Reinforced Concrete. It is not intended to replace the more rigorous analysis that is required for "Normal" Engineering Calculations.

Approx. Moment Capacity of Reinforced Slabs or Beams:

\[ M = \begin{cases} 2.8 \times A_s \times d & \text{(for 40 ksi yield strength)} \\ 4.0 \times A_s \times d & \text{(for 60 ksi yield strength)} \end{cases} \]

Where:  
- \( M \) = Moment Capacity in ft-kips. 
- \( A_s \) = Area of reinforcing steel (sq. in.) listed below. 
- \( d \) = Depth from compression face to center of steel.

Notes:
1. If in doubt, assume 40ksi yield strength for rebar.
2. The above assumes that the area of rebar is 1% or less of the concrete cross-section (b x d).
3. Shear capacity may govern any reinforced concrete design.

**Useful Information – Concrete Design Guide**
INTRO TO USEFUL TABLES – CRANE & RIGGING

Following this page there are tables that provide information that needs to be considered when ordering a Crane, information on the following:

- Crane Stability Safety Factors
- Wire Rope Slings
- Wire Rope Inspection
- Terminations
- Synthetic Slings
- Hoist Rings
- Wedge Anchors
- Concrete Screws

This Information has been reproduced from various sources, including:

The Crosby Group Inc, P.O. Box 3128 Tulsa, OK
1-800-777-1555
www.thecrosbygroup.com

The very useful Crosby User’s Pocket Guide is highly recommended as a reference to be used during all Urban Search & Rescue Activities. It may be obtained directly from The Crosby Group.
When you contact a rental source of heavy lift equipment, they will start asking questions to permit them to give you what you need. If you can have answers to their questions ready beforehand, you will speed the process considerably. If you have answers to the following questions, you will be well prepared for the rental agent:

1. Who are you and what are you doing?
2. How quickly do you want a machine?
3. What are the limits of room available for operation of the machine?
   - Overhead clearance?
   - Tail swing clearance?
   - Obstruction clearance?
   - Underpinning allowances?
   - Is there a place to assemble the boom (if lattice) and crane?
4. What are the capabilities of the onsite crew? (Are they qualified to assist with setup?)
5. If this is for multiple tasks:
   - What are the capabilities of the onsite crew? (Are they qualified to manage the machine?
   - Will multiple machines be needed? (Second machine to set up primary machine)
6. If this machine is for a single task, what is the load weight and
   - What is the load radius?
7. Will this task require pick and carry capability?
8. Pick and carry?
9. What are the limits of room available for operation of the machine?
   - Overhead clearance?
   - Tail swing clearance?
   - Underpinning allowances?
10. Is there a place to assemble the boom (if lattice) and crane?

When you contact a rental source of heavy lift equipment, they will ask questions to determine:

20 QUESTIONS TO ANSWER WHEN ORDERING A CRANE

USEFUL TABLES

US&R STRUCTURES SPECIALIST FOG
20 QUESTIONS to ANSWER WHEN ORDERING A CRANE
(continued)

11. Are there limitations on delivery of crane or parts?
   Posted bridges?
   Low clearances?
   Underground utilities?

12. What areas of operation are anticipated?
   Over rear?
   Over side?
   Over front?
   On rubber?

13. Are two crane (simultaneous) picks anticipated?

14. Will work be performed on a continuous (24 hr) basis? Is auxiliary lighting available?

15. Will radio communication be required to control load? Are dedicated radios available?

16. How much boom is required? Are special boom features (offset, open-throat) needed?

17. What size hook block is needed? Are shackles to fit hook available?

18. Will jib be needed?
   Jib length?
   Offset?
   Load?

19. Are additional rigging components needed?
   Load cell?
   Lift beams?
   Slings
   Shackles?

20. Who is the contact person and who is the person directing the rigging operations?

Given in terms of Diameter.
GENERAL SLING INFORMATION

Center of Gravity
The center of gravity of an object is that point at which the entire weight may be considered as concentrated. In order to make a level lift, the crane hook must be directly above this point. While slight variations are usually permissible, if the crane hook is too far to one side of the center of gravity, dangerous tilting and/or swinging will result and should be corrected at once. For this reason, when the center of gravity is closer to one point of the sling attachment than to the other, the slings must be of unequal length. The sling stresses and sling angle will also be unequal.

Working Load Limit or Design Load
The working load limit or design load is the useful rated capacity of a sling. This varies, depending upon the type of hitch. The working load limit table indicates, by illustration the applications for which the various useful loads apply, when the slings are new. All ratings are in tons or 2,000 pounds.

Safety Factor
In general, a safety factor of approximately five is maintained throughout these tables. However, certain sling fittings, such as hooks, which will straighten without breaking, or links, which will deform beyond usefulness before breaking, cannot be assigned a definite numerical safety factor. In such cases, suitable safe loads are listed, based upon wide experience and sound engineering practice.

Sling Care
Proper care and usage are essential for maximum service and safety. Wire rope and especially synthetic slings should be protected from sharp bends and cutting edges by means of corner saddles, burlap padding, or wood blocking. Heavy or continuous over-loading should be avoided as well as sudden jerks, which can build up a momentary over-load sufficient to break the sling. Wire rope slings should be stored where they are protected from moisture, and properly coiled when not in use.

Note: SHACKLES used must be one size greater or larger than the size of any shackles used to connect the legs to the load. In order for any of the above slings to be correct, the size of any shackles used must be one size greater or larger.

A Basket Hitch has Twice the Capacity of a Single Leg only if the D/d Ratio is 25/1 and the Legs are Vertical.

Wire Rope Inspection & Replacement

Replace rope if there are:
- 6 broken wires in one lay
- 3 broken wires in one strand in one lay
- 3 broken wires in one lay in Standing Ropes

Estimate rope condition at section showing maximum deterioration

Replace if:
1. See criteria above
2. One or more broken wires at a fitting
3. If any wire breaks in the valley between strands.
4. If any wire in a strand is worn by 1/3 it's diameter
5. Reduction in rope diameter should not exceed:
   - 3/64" for 3/4" rope
   - 1/16" for 7/8 to 1-1/4" ropes
   - 3/32" for larger ropes
6. Normal stretch for newer ropes can be expected to be 6" in 100' for 6 strand rope and 9" for 8 strand.
7. Corroded, kinked, cut, crushed, heat burnt, or bulging wires indicate improper handling - Discard Conditions

Note that broken wires should not be cut due to sharp edges. Bend wire back and forth until it breaks off inside the rope and is tucked away.

Keep ropes well lubricated inside and out to prevent deterioration. Document any broken wires.

</table>

**USEFUL TABLES**

**USER STRUCTURES SPECIALIST FOG**
WIRE ROPE CLIP INSTALLATION

1. Turnback, place 1st clip & torque/tighten.
2. Place 2nd clip only snug, no torque.
3. Place other clips at equal spacing.
4. Apply some tension and torque/tighten.
5. Recheck torque after initial operations.

WIRE ROPE CLIP SPLICES

1. Use two loop ends with thimble eye.
2. Overlap rope, use twice number clips reqd for 1 loop
3. Clips must be properly installed.

HURST- AIRSHORE RESCUE STRUTS
- Adjustable aluminum, pneumatic struts. (May use up to 50 psi air pressure to gently extend these struts).
- See Section 2 & 3 for other recommendations.
- Struts are available in various ranges of length (see Hurst-Airshore for available lengths, www.jawsoflife.com)
- Use adjustable collar and double pin system to transfer load from inner to outer tube.
- Listed loads are for use of 3 1/2” O.D. struts with SWIVEL ENDS and WITH or WITHOUT ONE 6ft, or 4ft EXTENSION placed on large (3 1/2") end.
- Adequacy of supporting material under strut, and need for header and sole should be verified by a competent Professional Engineer.

PARATECH RESCUE STRUTS
(DARK GREY ANODIZED COLOR)

- Adjustable aluminum, pneumatic struts. Use Acme Nut to transfer load from inner to outer tube.
- See Section 2 & 3 for other recommendations
- Struts are available in 1.5 to 2ft, 2ft to 3ft, 3ft to 5ft, & 5ft to 7.2ft ranges of length. (12”, 24” & 36” extensions are also available)
- Listed loads are based on 3” O.D. struts, tested with swivel ends, with and without one extension.
- See Pg 7-35 for Paratech 3 ½” O.D. Long Shore (Gold Color) Struts.
- Adequacy of supporting material under strut, and need for header and sole should be verified by a competent Professional Engineer.
- The following Load Table is based on tests performed by PARATECH and reviewed by Wiss, Janney, Elstner, Assoc., Engineers.

INTRODUCTION to SECTION 8

This section contains information that is primarily useful for the Structures Specialists that are deployed by the U.S. Army Corps of Engineers. USACE Structures Specialists may be deployed to a FEMA or non-FEMA US&R response.

The Information in Sect 8 is presented in the following order:

| Description of Duties and Mission Priorities | Page 8-2 |
| Management of Structures Specialist Cadre     | Page 8-3 |
| Personal Equipment List                        | Page 8-4 |
| Regular Deployable Equipment Cache             | Page 8-6 |
| Operational Checklists and Procedures          | Page 8-8 |
| System Description                             | Page 8-17|
| ICS Terminology                                | Page 8-20|
| INSARAG Marking System                         | Page 8-24|

(To be used in Foreign Deployments only)

Section 9 contains FEMA Structures Specialist General Instructions that includes: Position Descriptions, Operational Checklists, Equipment Checklists, and SIS Forms

Both USACE and FEMA Structures Specialist should review Section 9, prior to every incident.
The Structures Specialist is responsible for performing the various structural assessments for the rescue personnel during incident operations.

**DESCRIPTION OF DUTIES**

- The Structures Specialist is responsible for evaluating the immediate structural condition of the area to be entered during rescue operations.
- The Structures Specialist is responsible for determining the appropriate type and amount of structural hazard mitigation in order to minimize risks to rescue personnel.
- The Structures Specialist is responsible for determining the applicability type and amount of structural hazard mitigation in the area to be entered during rescue operations.
- The Structures Specialist is responsible for evaluating the immediate structural condition of the area to be entered during rescue operations.
- The Structures Specialist is responsible for performing the various structural assessments for the rescue personnel during incident operations.

**MISSION PRIORITIES**

Specific mission priorities will be decided by the State in conjunction with the Federal US&R team leaders; however, based on input from State Emergency Management personnel and the Federal US&R team leaders, the following priorities are listed for planning purposes:

**Priority 1:** Support to FEMA Task Forces for either backfilling or augmentation. Support the FEMA Incident Support Team (IST) engineering element.

- Support to FEMA Task Forces for either backfilling or augmentation.
- Support to FEMA Task Forces for either backfilling or augmentation.
- Support to FEMA Task Forces for either backfilling or augmentation.
- Support to FEMA Task Forces for either backfilling or augmentation.
MISSION PRIORITIES (continued)

Priority 2: Support to the Military by providing Structures Specialist augmentation with technical rescue operations.

Priority 3: Technical assistance to State, Regional, and Local jurisdictions with rescue efforts.

Priority 4: Other agency support.

MANAGEMENT OF STRUCTURES SPECIALIST CADRE

To effectively provide a management strategy and ensure the Structures Specialist Cadre is used effectively, the Urban Search and Rescue Program will be responsible for composition of the teams, which will be dependent on the scope and type of US&R mission. Once in the field, the Incident Commander should coordinate any action with the Disaster Field Office (DFO) and US&R staff members supporting the mission. The staff will normally be the US&R Mission Managers for the Corps. The Mission Managers may physically be located at the IST and be part of the IST engineering element, and coordinate with the Corps, DFO, IST, and other StS Cadre members.
Due to the need for rapid response to a disaster event, all personnel must have all necessary personal clothing, equipment and supplies readily available for immediate mobilization. Each personnel must have all necessary personal clothing, equipment due to the need for a disaster response to a disaster event.

**PERSONAL EQUIPMENT CHECKLIST**

List of Regular Equipment Cache Contents
- Accountability Tags
- US&R Operations Field Cap
- Short Sleeve Tees
- Long Sleeve Tees
- Gloves
- Firefighter Style Black Boots w/ Protective Toes
- 1/2 Face Mask Respirator w/ Cartridges
- Hearing Protection
- Safety Goggles
- US&R Helmet w/ “StS” Crescent Stickers
- Structures Specialist FOG
- BDU Style Uniforms
- Flight Bag/Rolling Duffle Bag

See page 8-6 for the Regular-Deployable Equipment Caches.

**1. PROVIDED TO SIS BY THE USACE US&R PROGRAM**

The following list provides the suggested minimum requirements to promote individual sufficiency during mission operations. The list includes required, recommended, and extra prescription eye wear. US&R cadre members should also pack two weeks of personal prescription medications. Over-the-counter medications, over-the-counter medications, and supplies necessary for immediate mobilization. Each personnel must have all necessary personal clothing, equipment due to the need for a disaster response to a disaster event.
PERSONAL EQUIPMENT CHECKLIST (continued)

2. ESSENTIAL PERSONAL ITEMS PROVIDED BY STS
   _____ Structures Specialist Forms (multiple copies)
   _____ Rain Gear & Extra Clothing for 7-10 Days
   _____ Sleeping Bag and Backpack
   _____ Cash, Personal I.D., Credit Cards, etc.
   _____ Personal Hygiene and Medication Items.
   _____ Eyeglasses, Safety Glasses + Extras
   _____ Cellular Phone & Charger
   _____ Sun Glasses, Sun Screen, Lip Balm, & Insect Repellent
   _____ Non-cotton underwear, including Boot Socks

3. RECOMMENDED PERSONAL EQUIPMENT
   _____ Paper/Notebook, Pens/Pencils.
   _____ Pocket Calculator w/ batteries & Inexpensive Watch.
   _____ Radio Harness and/or Hand Mike.
   _____ Tape Measure (20’ steel or 50’ cloth) and Duct Tape.
   _____ Laser Distance Meter, Inclinometer
   _____ Knife Tool, Field Glasses, Geology Hammer.
   _____ Digital Camera w/ Charger or Extra Batteries.
   _____ Extra Gloves, Laser Pointer, & Whistle.

4. SUGGESTED ADDITIONAL EQUIPMENT
   _____ Small Portable Radio.
   _____ Voice Activated Tape Recorder.
   _____ Pocket Air Horn & 6-foot Folding Tape Measure.

5. PERSONAL ITEMS AND SUGGESTED CLOTHING
   _____ Emer. Phone NOs, Shot Card, & Medical Insurance Info.
   _____ Bandannas and/or Cloth Neck Shield, Cotton Socks.
   _____ Underwear (inc long), Tee-Shirts, Pants, Heavy Sweater.
   _____ Wool Socks, Gym-Type Shorts, Sneakers, Sweatshirt.
   _____ Coat or Heavy Jacket, & Synthetic Absorbent Towel.
   _____ Ball Cap, Sweat Suit, & Light Jacket
   _____ Nail Clippers, Blister Repair Kit, & Laundry Soap (small)
6. PERSONAL ITEMS TO REMEMBER

PERSONAL EQUIPMENT CHECKLIST (continued)

REGULAR-DEPLOYABLE EQUIPMENT CACHES

- Eastern Region
  - EM Chief: David Schmidt, 972-318-2274
  - POC: Scott Acree, 978-318-8162
- Central Region
  - EM Chief: Robert Burnside, 513-684-3804
  - POC: Robert Taylor, 513-684-3089
- Western Region
  - EM Chief: Kelley Aasen, 415-503-6610
  - POC: Tom Nedelman, 415-503-6616

At least one of the caches are likely to be shipped for use by USACE. All of the caches are shipped regularly across the U.S. The contents of these caches are separated by function as follows:

(A CBRNE Cache is planned, but not available in 2012)

The contents of these caches are separated by function as follows:

- Eastern Region
  - EM Chief: David Schmidt, 972-318-2274
  - POC: Scott Acree, 978-318-8162

- Central Region
  - EM Chief: Robert Burnside, 513-684-3804
  - POC: Robert Taylor, 513-684-3089

- Western Region
  - EM Chief: Kelley Aasen, 415-503-6610
  - POC: Tom Nedelman, 415-503-6616

The contents of these caches are separated by function as follows:

(A CBRNE Cache is planned, but not available in 2012)
Monitoring/Measurement
- Total Station – one Nivo 5M, w/ extra battery & prism
- Spotting Scope w/ tripod
- 6 - Rino 553 Hcx GPS w/radio, US Maps, & battery adaptor
- 6 – Smart Levels and 1- Hilti Laser Level
- Crack Gage Kit
- Handheld Satellite Phone (planned 2012)

Office Equipment
- FOGs & SOGs, plus Field Notebooks
- Mobile Printer, Hand Scanner, & External 500 GB Hard Drive
- Office Supply Kit (pens, paper, etc), and US&R SIS Forms
- Calculator and Digital Camera
- Surge Protector/International Adaptors and Duct Tape
- 2 - Solar Notebook Charger
- HAZMAT Response Guidebook

Safety
- Full Body Harness (Rescue Rope + Hardware)
- Tarps and Rope/Straps
- 6 - Life Jackets, Additional PPE, and First Aid Kit
- 2 - LED Lantern

Tools
- Hilti Laser Level and 2 – Electronic Distance Meters
- DeWalt Inspection Camera and Flashlights/glow-sticks
- Plumb-Bob, Wind Meter, Penetrometer, and Binoculars
- 3lb Hammer, 2 - Geologist Hammer, and Pry Bar
- Various size Tape Measures and Chalk Line w/Chalk
- 2 – Tarps

Wireless Building Monitoring System
- 2 - Sensors
- 1 - Receiver
- 2 - Android Control Units

Tools/WBMS Mounting Kit
- Tools: Screwdrivers, Ratchet Set, Utility Blade, Pliers, & Clamp
- WBMS Mounting Plates and Straps
- 18v. Hammer Drill and 1/4"x 2" Tapcon Fasteners w/Drill
OPERATIONAL CHECKLISTS

The following operational checklists define the duties and responsibilities of the Corps Structures Specialist during mission assignments. The lists are intended to be a general summary of actions and may not include all actions required to complete the mission.

ALERT CHECKLIST

**PROCEDURES:**

Deployment

An ALERT is a warning message to stand by for possible mission.

- Special Instructions
- Duration of ALERT
- Possible Destination
- Nature of Disaster
- Take Situation Information, including:
- Report current availability status.
- Confirm message is an ALERT message.

MANAGER:

- Period or notification from HQ USACE or US&R Program.
- Stand down from ALERT only upon expiration of alert.
- Make preliminary preparations with family.
- Review Structures Specialist policies, procedures, and technical information.
- Check Equipment.
- Make preliminary preparations with family.
- Stand by for further instructions.

- Review Structures Specialist policies, procedures, and technical information.
- Check Equipment.
OPERATIONAL CHECKLISTS (continued)

DEPLOYMENT CHECKLIST

A DEPLOYMENT message indicates that you are being activated and will deploy to the disaster.

PROCEDURES:

Obtain:

_____ Point of departure
_____ Point of arrival
_____ Travel instructions
_____ Initial situation briefing
_____ Weather and climate conditions
_____ Maps of local disaster area (if possible)
_____ Reporting instructions
_____ HQ USACE & US&R PM POC

_____ Prepare family (See Family Preparedness Checklist).

_____ Monitor disaster-related information from local sources.

_____ Gather, prepare and pack equipment.

_____ Pack clothing and personal items for disaster area climate.

_____ Notify Supervisor and Emergency Management POC.

_____ Notify home station Critical Incident Stress provider.

_____ Move to Point of Departure (POD).

_____ At POD, notify HQ USACE and/or the US&R PM of status.

_____ Review Triage and Structures/Hazards Evaluation Forms.
The POA will likely be the same location as the mobilization area. This is the initial entry point for all disaster response resources. The POA will likely be the same location as the mobilization area. This is the initial entry point for all disaster response resources.

PROCEDURES:

- Report to Emergency Support Function #3, Public Works and Engineering and/or FEMA IST.
- Attend/familiarize with designated support unit/individual or Corps Cadre Overhead personnel if they have arrived.
- Check-in with designated support unit/individual or Corps Cadre Overhead personnel if they have arrived.
- Receive Situation Briefing/Update.
- Obtain/Retrieve Regular Equipment Cache, if shipped.
- Await assignment.
- Obtain food/quarters if required.
- HQ USACE EOC or US&R PM.
- If no Corps Cadre Overhead personnel, report arrival to HQ USACE EOC or US&R PM.
FAMILY PREPAREDNESS CHECKLIST

Ensuring that your family is taken care of and is informed about your deployment is an important part of your duties.

Some of the items on this checklist need to be taken care of prior to any alert or deployment message. Such items are in italics, and the checklist serves as a verification that you have reviewed them with your family.

_____ Will (location, etc.)

_____ Power of Attorney (location, scope, and provisions).

_____ Contact number at HQ USACE or USACE US&R Program Office.

_____ Employee Assistance Program telephone number.

_____ Critical Incident Stress Management (CISM) information.
The ASSIGNMENT is when you have been assigned to a specific Task Force, Unit, or Team.

INCIDENT CHECKLIST

The INCIDENT is the actual disaster site, which may be a single or multiple collapse, and may require light, medium or heavy US&R.

PROCEDURES:

_____ Obtain incident briefing from Incident Commander, IST or Unit Leader.

_____ Obtain pertinent building data (occupancy, special conditions, citizen reports, etc.).

_____ Gather appropriate building plans, etc., as available.

_____ Contact local structural engineers, contractors, and/or building department officials to determine construction data.

_____ Ensure use of all safety practices and procedures.

_____ Ensure your physical readiness through proper nutrition, water intake, rest and stress control techniques.

_____ Report any signs/symptoms of critical incident stress exhibited by yourself/coworkers.

_____ Brief your shift replacement fully on all ongoing operations when relieved at work cycle rotations.

_____ Participate in daily briefing.

_____ Assist remaining Task Force/Unit members as required.

_____ Support other IST missions.
The **Structural Assessment** is the key function of the Structures Specialist. Detailed references are located in Section 3 of this FOG. Development of Hazard Identification is key to the function of the Structures Specialist.

**US&R STRUCTURES SPECIALIST FOG**

**USACE GENERAL INSTRUCTIONS**
STRUCTURAL ASSESSMENT CHECKLIST (continued)

Provide assessment to Task Force/Team Leader, including:
- Recommendations for areas requiring hazard mitigation:
  - Shoring and bracing
  - Removal
  - Monitor with warning escape system
  - Avoidance
  - Discuss the most productive method of access relative to probable location of victims

Work with search and rescue personnel. Brief team on structural considerations. Mark building in accordance with the Structure/Hazards Evaluation and Search Assessment procedures. Determine the most appropriate course of action to gain access to victims, including:
- Most appropriate routes to conduct searches.
- Available tools and shoring materials.
- Structural materials likely to be found while gaining access.
- Effects of rescue operations on other building elements.
- Special precautions required during breaching operations.
- Special considerations for buildings with basements.
- Advice on the placement of shoring and bracing.
- Monitor the assigned structures for changing conditions.

Re-assess structures as required.
DEMOBILIZATION CHECKLIST

DEMOBILIZATION refers to all of the actions from disengaging from the last US&R incident through out-processing and your return home.

PROCEDURES:

UNIT & MOB AREA

______ Conduct out-brief with IST Engineering Cell or Unit Leader.

______ Re-supply of issued equipment if required.

______ Return unit/team equipment & Regular Equip. Cache.

______ Check-out from unit.

______ Report to Corps Overhead personnel.

______ Participate in any mission out-briefs or after-action sessions conducted by US&R managers and/or host jurisdiction.

______ Participate in CISM debriefing.

______ Return to Corps Overhead personnel.

HOME DUTY STATION

______ Attend CISM aftercare sessions.

______ Prepare and submit After-Action Report to Emergency Management POC and the US&R PM.

______ Attend CISM aftercare sessions.

UNIT & MOB AREA

______ Return home duty station.

______ Conduct out-brief with IST Engineering Cell or Unit Leader.

______ Re-supply of issued equipment if required.

______ Return unit/team equipment & Regular Equip. Cache.

______ Conduct out-brief with IST Engineering Cell or Unit Leader.

DEMOBILIZATION CHECKLIST (continued)

US&R STRUCTURES SPECIALIST FOG
SYSTEM DESCRIPTION

FEMA US&R TASK FORCES

MISSION: Heavy Rescue

STRENGTH: 70 positions / 24-hour operations

AUGMENTATION: DoD Liaison Team (4 Personnel)

AREA OF OPERATIONS: Single Incident or Geographic Area

STRUCTURES SPECIALIST: 2/Task Force

DATA: Multi-disciplinary Task Force

Self Contained for 72 hrs.

Extensive Medical & Equipment Cache

Organic Internal Communications

Extensive & Specialized Rescue Training
SYSTEM DESCRIPTION (continued)

CORPS US&R

Trains and maintains cadre of Structures Specialists using specialised equipment.

Corps US&R StS Cadre is a HQ USACE resource.

The StS Cadre is managed by the US&R Program Manager.

After coordination with the FEMA IST or DoD, the StS Cadre will be activated upon order from HQ USACE and the US&R Program Manager will assist with their notification and mobilization. The ENGLink system will indicate the available StS Red, White, or Blue Strike Team that is on call each month. All 3 Strike Teams may be activated depending on the type and size of the response.

HQ USACE UOC will conduct StS Cadre notification and mobilization in the event that the US&R Program Manager is unable to fulfill that function.

By direction of HQ USACE, operational overhead and management support will be provided by US&R Program Manager.

Upon arrival at the Mobilization Area, Structures Specialists assignments will be coordinated through the IST or the DFO.

Upon assignment, Structures Specialists will operate under the tactical control of the IC or Unit/Task Force Leader.

Logistical support will be provided by the receiving unit with DoD support if needed.

Corps Overhead personnel may be assigned to assist StS Cadre members with mobilization and demobilization.
The Incident Command System (ICS) is a standardized incident management system that provides maximum flexibility in providing resources in a changing situation.

**Organization:**

ICS is divided into 4 sections working under Incident Command:  

- **Incident Commander:** The IC is responsible for all incident activities, including ordering and releasing of resources.
- **General Staff:** The General Staff is comprised of the Safety Officer, Information Officer, Operations Officer, and the Section Chiefs. They provide support to the IC in the management of the incident.
- **Operations Section:** This section is responsible for the planning and execution of all operations related to the primary incident mission.
- **Planning Section:** This section is responsible for the collection, analysis and dissemination of all information about the incident and resource status.
- **Logistics Section:** This section is responsible for providing facilities, services, and materials in support of the incident.
- **Finance Section:** This section is responsible for financial and cost analysis aspects of the incident.

The basic ICS organization is divided into 4 sections working under Incident Command:  

- **Incident Commander:** The IC is responsible for all incident activities, including ordering and releasing of resources.
- **General Staff:** The General Staff is comprised of the Safety Officer, Information Officer, Operations Officer, and the Section Chiefs. They provide support to the IC in the management of the incident.
- **Operations Section:** This section is responsible for the planning and execution of all operations related to the primary incident mission.
- **Planning Section:** This section is responsible for the collection, analysis and dissemination of all information about the incident and resource status.
- **Logistics Section:** This section is responsible for providing facilities, services, and materials in support of the incident.
- **Finance Section:** This section is responsible for financial and cost analysis aspects of the incident.
US&R STRUCTURES SPECIALIST FOG
USACE GENERAL INSTRUCTIONS

SYSTEM DESCRIPTION (continued)

INCIDENT COMMAND SYSTEM (continued)

US&R OPERATIONS

Below is an example of an ICS Flow Chart in its most basic form. US&R Task Forces normally operate under the Operations Section:
Agency Representative. Reporting to the Liaison Officer, this individual represents their agency and has the authority to make decisions on all matters regarding the agency’s participation in the incident.

Allocated Resources. Resources dispatched to an incident.

Assigned Resources. Resources checked in and assigned work tasks on an incident.

Available Resources. Resources assigned to an incident and available for assignment.

Base. The location at which the primary logistical functions are coordinated and administered.

Branch. The organizational level having a geographic/functional responsibility for major parts of incident operations. It lies between the Section and Division levels.

Dispatch. The implementation of a command to move a resource(s) from one place to another.

Dispatch Center. A facility where resources are directly assigned and dispatched. A facility where resources are directly assigned and dispatched from one place to another.

System Description (continued)
DIVISION. That organizational level having responsibility over a defined geographic area. It sits between the Strike Team/Task Force and the Branch.

GROUP. A functionally organized Division (i.e., Rescue, Fire Suppression).

HELibase. A location within the incident area for parking, fueling, maintaining and loading helicopters.

Mobilization Center. An off-incident location where resources are temporarily located pending assignment, reassignment, or release.

Operational Period. The period of time scheduled for the execution of a given set of operational actions.

Staging Area. That location where incident personnel and equipment are assigned on a 3-minute available status.

Strike Team. Specified combinations of the same type of resource with common communications and a leader.

Task Force. A group of resources with a leader and common communications temporarily assembled for a given mission.
INSARAG MARKING SYSTEM

This is the marking system that was developed by the United Nations, International Search & Rescue Advisory Group. It is used outside of the US for marking structures where SAR operations are taking place. USACE StS may encounter this if serving overseas.

The basic symbol consists of a 1 meter by 1 meter square box at the primary access point into any compromised structure.

- Information will be conspicuously made with fluorescent color to permanently identify and mark the structure.
- When all operations have been completed, the Square will be encircled so that all information is contained within the circle.
- If another Team relieves the first Team, their name symbol is permanently added as the search and rescue operations proceed.
- Upon entry, the name of the Team is written, and the remainder of the information will be added as the search and rescue proceeds.
- If any Team is unable to leave the building, the remainder of the information will be conspicuously made with fluorescent color to the primary access point into any compromised structure.

INTRODUCTION to SECTION 9

This section contains information that is useful for all Structures Specialists, and should be reviewed while in transit to an incident.

The Information in Section 9 is presented as follows:

- Description of Duties  Page 9-1
- Personal Equipment Checklists  9-2
- Operational Checklists and Procedures  9-4
- Ten StS Talking Points – What StS can do for T.F.  9-10
- Fire Service Uniform Insignia – How to I.D. Leadership  9-10
- Structures Spec Forms (small scale examples)  9-11

The Structures Specialist is responsible for performing various structural assessments for the Task Force during incident operations. The Structures Specialist reports directly to the Planning Team Manager, but during operations, will normally be assigned to the Search Team Manager or Rescue Team Manager.

DESCRIPTION OF DUTIES

- The Structures Specialist is responsible for evaluating the immediate structural condition of the area to be entered at the rescue site during task force operations.
- The Structures Specialist is responsible for determining the appropriate type and amount of structural hazard mitigation in order to minimize risks to task force personnel on site.
- The Structures Specialist is responsible for cooperating with and assisting search and rescue resources.
- The Structures Specialist is accountable for all issued equipment.
- The Structures Specialist performs additional tasks or duties as assigned during a mission.
Due to the need for rapid response to a disaster event, all personnel must have necessary personal clothing, equipment, and supplies readily available for immediate mobilization. Each team member should also pack two weeks of personal prescription medications, over-the-counter medications commonly used for colds, allergies, etc. and extra prescription eye wear. The following list is the suggested minimum requirements to promote individual sufficiency during mission operations:

1. PROVIDED BY TASK FORCE (confirm with your Task Force)
   - UNIFORM-BLOUSE, T-SHIRTS, PANTS; MULTIPLE SETS
   - RAIN GEAR & BRIEF RELIEFS
   - COOL WEATHER FLEECE TOPS/BOTTOMS & GLOVES
   - LONG UNDERWEAR & COOL WEATHER HAT
   - BOOTS W/ STEEL TOES & SHANK (check for comfort)
   - FIELD PACK, SLEEPING BAG, & SLEEPING PAD
   - HELMET W/ HEADLIGHT, SAFETY GLASSES, & GOOGLEs
   - FIELD PACK, SLEEPING BAG, & SLEEPING PAD
   - PORTABLE RADIO W/ HARNESS, GPS & WIND METER
   - FIRST AID KIT & CPR MASK
   - HAND SANITIZER BOTTLE, WATER BOTTLES & MREs
   - SUNSCREEN WIPES & INSECT REPELLENT WIPES
   - MULTI-PURPOSE TOOL & CHEMICAL LIGHT STICKS
   - HAND SANITIZER, WIPES, GLOVES, & KNEE PADS
   - LONG UNDERWEAR & COOL WEATHER HAT
   - CRACK MONITORS, ANCHORS/ADHESIVES
PERSONAL EQUIPMENT CHECKLIST (continued)

2. RECOMMENDED SUPPLEMENTAL TECHNICAL ITEMS

- Mechanics Gloves & Multi-Purpose Tool
- SIS FOG, ATC 20-1 Field Guide, All SIS Forms
- Duct Tape, Laser Pointer, & Soil Penetrometer
- Digital Camera, Extra Batteries & Storage Media
- Voice Activated Tape Recorder & Whistle
- Pocket Air Horn & 3 FT Folding Tape Measure

3. ESSENTIAL PERSONAL ITEMS

- Rain Gear & Extra Clothing for 7 Days
- Cash, Personal I.D., Credit Card, ETC.
- Personal Hygiene & Medication Items
- Sun Screen, Lip Balm, & Insect Repellent
- Eyeglasses, Safety Glasses, + Extras
- Personal Medical & Medical Insurance Info
- Non Cotton Underwear, Inc Boot Socks

4. RECOMMENDED SUPPLEMENTAL PERSONAL ITEMS

- Emergency Phone Numbers, Pocket Note Pad
- Cell Phone & Personal Electronics + Charger
- Inexpensive Wrist Watch & Sun Glasses
- Bandannas, And/or Cloth Neck Shield
- Nail Clippers & Blister Repair Kit
- Mouthwash (small bottle) or Breath Strips
- Laundry Soap (small quantity)
- Synthetic Absorbent Towel
- Peppermint Oil (to avoid scene odors)
- Long Underwear, Cotton Socks
- Underwear, Tee Shirts, Trousers, HVY Sweater
- Wool Socks, Gym-Type Shorts, Sneakers
- Ball Cap, Sweat Suit, & Light Jacket
UPON ACTIVATION / AT TF ASSEMBLY POINT

[   ] Receive notification of assignment and instructions from the initiating organization.

[   ] Establish communications with the assigned Planning Team Manager and receive initial briefing, and determine if IST has been Activated for this incident.

[   ] Monitor disaster-related information from local sources.

[   ] Gather relevant data on building construction in disaster area.

[   ] Establish communications with the assigned Planning Team Manager and receive initial briefing, and determine if IST has been Activated for this incident.

[   ] Receive notification of assignment and instructions from the initiating organization.

[   ] Make necessary changes.

[   ] Personal gear readiness for the specific disaster area climate.

[   ] Personal equipment checklist. Assess your personal gear.

[   ] Review the personal equipment checklist. Assess your personal gear.

[   ] Review the personal equipment checklist. Assess your personal gear.

[   ] Review all Structures Specialist forms, especially RST (RST-1 & 2) plus Hazard Assessment (HZA-1, 2, & 3).

[   ] Review all Structures Specialist forms, especially RST (RST-1 & 2) plus Hazard Assessment (HZA-1, 2, & 3).

[   ] Review operation of equipment.

[   ] Review operation of equipment.

[   ] Review all Structures Specialist forms, especially RST (RST-1 & 2) plus Hazard Assessment (HZA-1, 2, & 3).

[   ] Review all Structures Specialist forms, especially RST (RST-1 & 2) plus Hazard Assessment (HZA-1, 2, & 3).

[   ] Identify immediate TF Supernvisor. Initiate and maintain the organizational structure integrity of the Search Team throughout all phases of the mission.

[   ] Identify immediate TF Supernvisor. Initiate and maintain the organizational structure integrity of the Search Team throughout all phases of the mission.

[   ] Medical Team Manager.

[   ] Medical Team Manager.

[   ] Forward an accurate Responder Information Sheet to the Medical Team Manager.

[   ] Identify immediate TF Supernvisor. Initiate and maintain the organizational structure integrity of the Search Team throughout all phases of the mission.

[   ] Identify immediate TF Supernvisor. Initiate and maintain the organizational structure integrity of the Search Team throughout all phases of the mission.

[   ] Report to the assigned assembly point at the prescribed time.

[   ] Report to the assigned assembly point at the prescribed time.

[   ] Brief TF personnel on building construction/considerations to be anticipated in the affected area.

[   ] Brief TF personnel on building construction/considerations to be anticipated in the affected area.

[   ] Assist with the transfer and loading of the task force equip.

[   ] Assist with the transfer and loading of the task force equip.

[   ] Monitor disaster-related information from local sources.

[   ] Monitor disaster-related information from local sources.

[   ] Review electronic level, total station, distance measuring tools, metal detector, etc.
OPERATIONAL CHECKLIST  continued)

AT POINT OF DEPARTURE

[ ] Assemble for a task force briefing from the Task Force Leader and appropriate officials.

[ ] Assist with the movement and loading of equipment.

[ ] Ensure that you receive any appropriate issue of gear (radio, functional vest, etc.) pertinent to the position.

[ ] Ensure that you have personal day pack, ear plugs, warm clothes for flight.

[ ] Ensure that the battery is removed from your portable radio prior to boarding aircraft.

IN TRANSIT

[ ] Review the latest disaster-related information as it becomes available.

[ ] Review the FEMA US&R Field Operations Guide for information pertinent to your position description, operational check-list, operational procedure, and safety procedures.

[ ] Take advantage of available travel time for rest prior to arrival.
ARRIVAL AT MOBILIZATION CENTER

[ ] Identify cache supplies and equipment that should receive priority for initial movement to the assigned area. Assist as necessary in the departure to the assigned jurisdiction or incident site.

[ ] Brief Rescue Mgr, Search Mgr, Safety Officer, and Heavy Equipment and Rigging Spec of relevant structural concerns.

[ ] Confirm that IST StS position has been filled, and determine coordination and communication protocol with IST StS.

[ ] Request access to Structural, Architectural & Mechanical-Electrical-Plumbing plans.

[ ] Determine number, occupancies, & building construction.

[ ] Determine age & occupancy of structures.

[ ] Determine numbers of people in buildings at time of incident, and how many assumed trapped.

ON-SITE OPERATIONS

[ ] If required, assist the Logistics Specialist with the unloading, sorting and set-up of the equipment cache and the task force

[ ] Receive initial briefing of incident assignment from the Task Force Leader or Planning Team Manager to include:

  ● Incident Situation Report.
  ● Task Force Objectives and assign tasks.
  ● Incident Situation Report.
  ● Force Leader or Planning Team Manager to include:

  1. Receive initial briefing of incident assignment from the Task Force and Planning Team Manager to include:

  2. If required, assist the Logistics Specialist with the unloading, sorting and set-up of the equipment cache and the task force.

  3. Support facilities should not interfere with critical Recon and set-up of the equipment cache and the task force.

  4. If required, assist the Logistics Specialist with the unloading, sorting and set-up of the equipment cache and the task force.

ON-SITE OPERATIONS

[ ] Incidents and how many assumed trapped.

  ● Determine number of people in buildings at time of incident.
  ● Determine age & occupancy of structures.
  ● Determine number of occupants & building construction.
  ● Electric-Plumbing plans.
  ● Request access to Structural, Architectural & Mechanical.
  ● Coordination and communication protocol with IST StS.
  ● Confirm that IST StS position has been filled, and determine

  1. Equipment and rigging spec of relevant structural components.
  2. Basic Rescue Mgr, Search Mgr, Safety Officer, and Heavy

  3. Incident site.

  4. Identify cache supplies and equipment that should receive
OPERATIONAL CHECKLIST (continued)

ON-SITE OPERATIONS (continued)
[ ] Conduct Rapid Structure Triage operations as directed:
  ● Concise ID/location of structures.
  ● Rapid assessment of the affected area.
  ● ID potential buildings that require a more detailed assessment/search.
  ● Use the Rapid Structure Triage Form (see Sec. 8).

[ ] Perform an assessment of assigned structures exterior and interior to determine structure type, location of falling or collapse hazards, and access points. This would include:
  ● Use SIS Checklist Form HAZ-3.
  ● Seek the following information:
    ▪ Type, age & occupancy of structure
    ▪ Availability of Structural, Arch & MEP plans
    ▪ Layout of bldg & probable location of occupants
    ▪ Location and status of utilities, emergency generators, fuel tanks, batteries and solar electric systems
    ▪ Pre-existing problems and/or ongoing construction
  ● Clearly mark the structure(s) assessed at the point of entry in accordance with the standard marking system.
  ● Draw a crude plan to indicate possible access points, locations of structural hazards, and the most productive methods of hazard reduction.
  ● Note the indication of all access/egress routes (i.e., corridors, stairs, elevators, duct & pipe access) for possible voids, victim locations, and access.
  ● Clearly mark off hazardous areas that are to be avoided.

[ ] Participate in RST operations as directed. Task Force on structural considerations. Mark buildings in accordance with the Structure/Hazards Evaluation Marking Sys.

[ ] Gather Structural, Architectural & MEP plans, etc. as available from facilities staff, building officials, engineer of record & contractors. (coordinate this with IST SIS).

[ ] Work with HERS to determine availability of heavy equipment and contractors.
ON-SITE OPERATIONS (continued)

When relieved at work cycle rotations, brief your shift replacement fully on all ongoing operations and equipment malfunctions.

Accomplishments of conflicts, supply deficiencies, or keep the Planning Team Manager apprised of any tactical specialists established protocols.

Operational checklists continue all activities with IST Structures. In adverse, rest, and stress control techniques. Ensure your physical readiness through proper nutrition, water intake.

Monitor the assigned structures for changing conditions. Advise on the placement of sawing and breaking materials. Special considerations of buildings with basements. Special precautions required during breaching operations. Effects of rescue operations on other building elements. While gaining access, determine what structural materials are likely to be found. Most appropriate tools to conduct searches. Would include:

Appropriate course of action to gain access to victims. This includes:

Work with search and rescue personnel to determine the most probable location of victims.

Discuss the most productive method of access relative to
- Shore and brace
- Carefully remove
- Monitor with warning evacuation plan
- Minimize exposure
- Avoid a place barrier take
- Recommendation for areas requiring hazard mitigation.

Provide assessment to TF Team managers, including:

OPERATIONAL CHECKLIST (continued)
OPERATIONAL CHECKLIST (continued)

REASSIGNMENT / DEMOBILIZATION

[ ] Assemble for a team briefing on the mission status and reassignment/demobilization determinations.

[ ] Ensure that assigned tools and equipment are inventoried, returned to the cache, and prepared for movement.

[ ] Prepare personal belongings for demobilization.

[ ] Notify the Logistics Specialist of losses or potential maintenance requirements of any tools and equipment.

[ ] Assist with the break down and policing of the Base of Operations.

[ ] Assist with the packaging, movement, and loading of the equipment cache.

[ ] Submit personal notes to the Planning Team Manager for inclusion in the after-action reports. This should include reviewing pertinent position descriptions and operational checklists and procedures for recommended changes.

[ ] Ensure the return of items issued during the activation phase.

[ ] Upon return, participate in the task force mission critique and CISD debriefing.
WHAT CAN STS DO FOR THE TASK FORCE?

1. Identify structural hazards that threaten the safety of rescue personnel.
2. Identify alternatives for mitigation of structural hazards to minimize risks to rescue personnel.
3. Design mitigation measures, including shoring and bracing using available materials.
4. Monitor structural stability under changing conditions to minimize risks to rescue personnel.
5. Identify potential voids where victims may be located; identify most efficient access route to voids.
6. Provide orientation and marking within a structure.
7. Assist with the placement of heavy equipment.
8. Assist with heavy debris removal.
9. Triage collapse areas for search and rescue operations.
10. Liaison with IST and other TF STS for detailed and current building information.

HOW DO YOU KNOW WHO ARE WE TALKING TO?

Typical Insignia on Fire Personnel Uniforms

Typical Insignia on Fire Personnel Uniforms

How do you know who are we talking to?

Building Information:

Liaison with IST and other TF STS for detailed and current building information.

Assist with preparation of search maps and IAP.

Liaison with IST and other TF STS for detailed and current building information.

Assist with heavy debris removal.

Assist with heavy equipment placement.

Provide orientation and marking within a structure.

How to identify potential voids where victims may be located: identify structural hazards that threaten the safety of rescue personnel.

Identify structural hazards that threaten the safety of rescue personnel.

Identify structural hazards that threaten the safety of rescue personnel.

Typical insignia include:

- Fire Chief or Chief of Department: five crossed gold bugles.
- Deputy Chief: four crossed gold bugles.
- Division Chief: three crossed gold bugles.
- Battalion Chief: two crossed gold bugles.
- Fire Captain: double silver bugles.
- Lieutenant: single silver bugle - elsewhere.
- Fire Apparatus Engineer: single silver bugle - West Coast.
- Firefighter I or II: no insignia on the uniform.
The following shows samples of Forms that should be used by FEMA US&R Structures Specialists in order to efficiently document their activities during an incident.

The Forms are arranged as follows:

- Rapid Structure Triage Forms - RST-1 & RST-2 (see Sect 6)
- Structure/Hazard Assessment Forms - HAZ-1 and HAZ-2
- Structure/Hazard Assessment Checklist - HAZ-3
- Struct Hazard Mitigation - Forms MIT-1 and MIT-Log
- Landscape Structure Monitoring Forms - MON-1, MON-2, CP-Log, and MON-Log
- Portrait Structure Monitoring Log Form - MON-Log-P
- Structures Spec. Shift Change Form - Hand-Off
- Crane Use Form - CU-1
- Shoring Checklist - SHOR-1
- Tunnel/Hazards Evaluation Form - T-HAZ-1
- Rapid Bridge Assessment Form - RBA-1

Full size copies of these forms may be downloaded from DisasterEngineer.org in the Library Section.

MIT-1 is formatted like a Termite Report Form, where a sketch is used as a location map where specific types of Mitigation are located by writing in a Locator Number. This number is then related to a specific type of Mitigation, that is defined in the upper right of the form by an abbreviation. A numerical priority is also assigned to this specific Mitigation. More than one Mitigation may have the same number used to specify its priority. Form MIT-Log is then used to record actions taken to complete the specific mitigations, and used as a communication tool to Hand-off to the oncoming StS.

MON-1, MON-2, CP-Log, & MON-Log in landscape orientation are intended for use with the Total Station. They are used to identify monitoring setup, and to record periodic readings. MON-Log-P (portrait) provides more reading on single sheet. MON-1, MON-Log, & MON-Log-P may be used to record data from other monitoring devices. All MON forms are good docs for Handoff.

Hand-Off, CU-1, T-HAZ-1, & RBA-1 are good for communication, as checklists and for record. SHOR-1 is a reminder checklist.
